[58185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1728 gene, herein designated VGAM GENE, on one or more VGAM1728 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[58186] It is yet further appreciated that a function of VGAM1728 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1728 correlate with, and may be deduced from, the identity of the host target genes which VGAM1728 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58187] Nucleotide sequences of the VGAM1728 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1728 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1728 are further described hereinbelow with reference to Table 1.

[58188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1728 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1728 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58189] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1728 gene, herein designated VGAM is inhibition of expression of VGAM1728 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1728 correlate with, and may be deduced from, the identity of the target genes which VGAM1728 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58190] ATPase, H<sup>+</sup> Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM\_130463) is a VGAM1728 host target gene. ATP6V1G2 BINDING SITE1 and ATP6V1G2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATP6V1G2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1G2 BINDING SITE1 and ATP6V1G2 BINDING SITE2, designated SEQ ID:28223 and SEQ ID:28697 respectively, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58191] A function of VGAM1728 is therefore inhibition of ATPase, H<sup>+</sup> Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 2 (ATP6V1G2, Accession NM\_130463). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1G2. FLJ11806 (Accession NM\_024824) is another VGAM1728 host target gene. FLJ11806 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11806 BINDING SITE, designated SEQ ID:24215, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58192] Another function of VGAM1728 is therefore inhibition of FLJ11806 (Accession NM\_024824). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11806. FLJ22055 (Accession NM\_024779) is another VGAM1728 host target gene. FLJ22055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22055, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22055 BINDING SITE, designated SEQ ID:24146, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58193] Another function of VGAM1728 is therefore inhibition of FLJ22055 (Accession NM\_024779). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22055. KIAA0960 (Accession XM\_166543) is another VGAM1728 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44515, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58194] Another function of VGAM1728 is therefore inhibition of KIAA0960 (Accession XM\_166543). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0960. KIAA1922 (Accession XM\_057040) is another VGAM1728 host target gene. KIAA1922 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:36461, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58195] Another function of VGAM1728 is therefore inhibition of KIAA1922 (Accession XM\_057040). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922. MIC2 Like 1 (MIC2L1, Accession NM\_031462) is another VGAM1728 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25492, to the

nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58196] Another function of VGAM1728 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM\_031462). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. PXR2b (Accession NM\_016559) is another VGAM1728 host target gene. PXR2b BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXR2b, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXR2b BINDING SITE, designated SEQ ID:18634, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58197] Another function of VGAM1728 is therefore inhibition of PXR2b (Accession NM\_016559). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXR2b. LOC206426 (Accession XM\_116505) is another VGAM1728 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC206426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43116, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58198] Another function of VGAM1728 is therefore inhibition of LOC206426 (Accession XM\_116505). Accordingly, utilities of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC92935 (Accession XM\_048197) is another VGAM1728 host target gene. LOC92935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92935 BINDING SITE, designated SEQ ID:35130, to the nucleotide sequence of VGAM1728 RNA, herein designated VGAM RNA, also designated SEQ ID:4439.

[58199] Another function of VGAM1728 is therefore inhibition of LOC92935 (Accession XM\_048197). Accordingly, utilities

of VGAM1728 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92935. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1729 (VGAM1729) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58200] VGAM1729 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1729 was detected is described hereinabove with reference to Figs. 1-8.

[58201] VGAM1729 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58202] VGAM1729 gene encodes a VGAM1729 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1729 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1729 precursor RNA is desig-

nated SEQ ID:1715, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1715 is located at position 8293 relative to the genome of Rabies Virus.

- [58203] VGAM1729 precursor RNA folds onto itself, forming VGAM1729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58204] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1729 folded precursor RNA into VGAM1729 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1729 RNA is designated SEQ ID:4440, and is provided hereinbelow with reference to the sequence

listing part.

[58205] VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1729 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58206] VGAM1729 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1729 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1729 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58207] The complementary binding of VGAM1729 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1729 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1729 host target RNA into VGAM1729 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58208] It is appreciated that VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1729 host target genes. The mRNA of each one of this plurality of VGAM1729 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1729 RNA, herein designated VGAM

RNA, and which when bound by VGAM1729 RNA causes inhibition of translation of respective one or more VGAM1729 host target proteins.

[58209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1729 gene, herein designated VGAM GENE, on one or more VGAM1729 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58210] It is yet further appreciated that a function of VGAM1729 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1729 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1729 correlate with, and may be deduced from, the identity of the host target genes which VGAM1729 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58211] Nucleotide sequences of the VGAM1729 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1729 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1729 are further described hereinbelow with reference to Table 1.

[58212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1729 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1729 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58213] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1729 gene, herein designated VGAM is

inhibition of expression of VGAM1729 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1729 correlate with, and may be deduced from, the identity of the target genes which VGAM1729 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58214] Melanoma Antigen, Family C, 1 (MAGEC1, Accession NM\_005462) is a VGAM1729 host target gene. MAGEC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAGEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEC1 BINDING SITE, designated SEQ ID:11945, to the nucleotide sequence of VGAM1729 RNA, herein designated VGAM RNA, also designated SEQ ID:4440.

[58215] A function of VGAM1729 is therefore inhibition of Melanoma Antigen, Family C, 1 (MAGEC1, Accession NM\_005462), a gene which is a member of the MAGE family C. Accordingly, utilities of VGAM1729 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEC1. The function of

MAGEC1 has been established by previous studies. Members of the MAGE (see OMIM Ref. No. MAGEA1, 300016), BAGE (OMIM Ref. No. 605167), and GAGE (see OMIM Ref. No. 604244) gene families are expressed in tumor cells and male germline cells and encode antigens recognized by cytotoxic T lymphocytes. These antigens are also known as CT antigens (see OMIM Ref. No. 300156) for their expression in cancer cells and testis. Lucas et al. (1998) used representational difference analysis to identify new CT antigen genes. They isolated a cDNA fragment showing homology to MAGE family genes. The fragment was used to isolate a full-length cDNA clone from an melanoma cell cDNA library. The MAGEC1 cDNA predicts a protein of 1,142 amino acids. MAGEC1 is 800 amino acids longer than other MAGE proteins due to the insertion of a large number of short repetitive sequences. RT-PCR analysis showed expression of MAGEC1 in tumors of a wide variety of histologic types, but expression was not seen in normal tissues, with the exception of testis. Lucas et al. (1998) determined that the MAGEC1 gene contains 4 exons and spans over 6 kb. Chen et al. (1998) screened an expression cDNA library constructed from a melanoma cell line with an allogeneic melanoma patient serum

known to contain antibodies against CT antigens. They isolated a cDNA encoding a new CT antigen, CT7, the sequence of which was more than 99% identical to that of MAGEC1 in the coding region.

[58216] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58217] Chen, Y.-T.; Gure, A. O.; Tsang, S.; Stockert, E.; Jager, E.; Knuth, A.; Old, L. J. : Identification of multiple cancer/testis antigens by allogeneic antibody screening of a melanoma cell line library. Proc. Nat. Acad. Sci. 95: 6919-6923, 1998. ; and

[58218] Lucas, S.; De Smet, C.; Arden, K. C.; Viars, C. S.; Lethe, B.; Lurquin, C.; Boon, T. : Identification of a new MAGE gene with tumor-specific expression by representational difference ana.

[58219] Further studies establishing the function and utilities of MAGEC1 are found in John Hopkins OMIM database record ID 300223, and in cited publications numbered 8802-8803 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Vinculin (VCL, Accession NM\_003373) is another VGAM1729 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2

are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:9405 and SEQ ID:15194 respectively, to the nucleotide sequence of VGAM1729 RNA, herein designated VGAM RNA, also designated SEQ ID:4440.

[58220] Another function of VGAM1729 is therefore inhibition of Vinculin (VCL, Accession NM\_003373). Accordingly, utilities of VGAM1729 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCL. KIAA1161 (Accession XM\_088501) is another VGAM1729 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39756, to the nucleotide sequence of VGAM1729 RNA, herein designated VGAM RNA, also designated SEQ ID:4440.

[58221] Another function of VGAM1729 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities of VGAM1729 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1730 (VGAM1730) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58222] VGAM1730 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1730 was detected is described hereinabove with reference to Figs. 1–8.

[58223] VGAM1730 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58224] VGAM1730 gene encodes a VGAM1730 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1730 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1730 precursor RNA is designated SEQ ID:1716, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1716 is located at position 6659 relative to the genome of Rabies Virus.

- [58225] VGAM1730 precursor RNA folds onto itself, forming VGAM1730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58226] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1730 folded precursor RNA into VGAM1730 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1730 RNA is designated SEQ ID:4441, and is provided hereinbelow with reference to the sequence listing part.

[58227] VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1730 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58228] VGAM1730 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1730 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1730 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58229] The complementary binding of VGAM1730 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1730 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1730 host target RNA into VGAM1730 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58230] It is appreciated that VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1730 host target genes. The mRNA of each one of this plurality of VGAM1730 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1730 RNA, herein designated VGAM RNA, and which when bound by VGAM1730 RNA causes inhibition of translation of respective one or more VGAM1730 host target proteins.

[58231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1730 gene, herein designated VGAM GENE, on one or more VGAM1730 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58232] It is yet further appreciated that a function of VGAM1730

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1730 correlate with, and may be deduced from, the identity of the host target genes which VGAM1730 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58233] Nucleotide sequences of the VGAM1730 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1730 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1730 are further described hereinbelow with reference to Table 1.

[58234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1730 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1730 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58235] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1730 gene, herein designated VGAM is inhibition of expression of VGAM1730 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1730 correlate with, and may be deduced from, the identity of the target genes which VGAM1730 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58236] Cadherin 18, Type 2 (CDH18, Accession NM\_004934) is a VGAM1730 host target gene. CDH18 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDH18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH18 BINDING SITE, designated SEQ ID:11380, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58237] A function of VGAM1730 is therefore inhibition of Cadherin 18, Type 2 (CDH18, Accession NM\_004934), a gene which mediates neural cell-cell interactions and may play an important role in neural development. Accordingly, utilities of VGAM1730 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CDH18. The function of CDH18 has been established by previous studies. To isolate cDNAs encoding proteins that interact with beta-catenin, Shibata et al. (1997) screened a human adult brain cDNA expression library with recombinant beta-catenin protein. They identified a cDNA with high sequence homology to cadherin molecules and designated it cadherin-14 (CDH14), which has been renamed cadherin-18 (CDH18). Comparison of the deduced 790-amino acid CDH18 sequence with the sequences of other cadherins revealed that CDH18 is more closely related to type 2 cadherins than to type 1 cadherins, with the N-terminal regions of CDH18 and CDH12 (OMIM Ref. No. 600562) showing particularly high amino acid similarity. Northern blot analysis of human tissues detected 9.7-, 5.5-, and 3.9-kb CDH18 transcripts specifically in the central nervous system; CDH18 expression was also found in small-cell lung carcinoma cell lines, which have neuroectodermal cell phenotypes

[58238] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58239] Chalmers, I. J.; Hofler, H.; Atkinson, M. J. : Mapping of a

cadherin gene cluster to a region of chromosome 5 subject to frequent allelic loss in carcinoma. Genomics 57: 160–163, 1999. ; and

[58240] Shibata, T.; Shimoyama, Y.; Gotoh, M.; Hirohashi, S. : Identification of human cadherin–14, a novel neurally specific type II cadherin, by protein interaction cloning. J. Biol. Chem. 2.

[58241] Further studies establishing the function and utilities of CDH18 are found in John Hopkins OMIM database record ID 603019, and in cited publications numbered 587 and 8014 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_078470) is another VGAM1730 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27794, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58242] Another function of VGAM1730 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM\_078470). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Dihydropyrimidinase-like 3 (DPYSL3, Accession NM\_001387) is another VGAM1730 host target gene. DPYSL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYSL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL3 BINDING SITE, designated SEQ ID:7074, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58243] Another function of VGAM1730 is therefore inhibition of Dihydropyrimidinase-like 3 (DPYSL3, Accession NM\_001387), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL3. The function of DPYSL3 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Estrogen Receptor 1 (ESR1, Accession NM\_000125) is another VGAM1730 host target gene. ESR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESR1 BINDING SITE, designated SEQ ID:5601, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58244] Another function of VGAM1730 is therefore inhibition of Estrogen Receptor 1 (ESR1, Accession NM\_000125), a gene which involved in hormone-mediated inhibition of gene expression. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESR1. The function of ESR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM695. Klotho (KL, Accession NM\_004795) is another VGAM1730 host target gene. KL BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by KL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KL BINDING SITE, designated SEQ ID:11204, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58245] Another function of VGAM1730 is therefore inhibition of Klotho (KL, Accession NM\_004795), a gene which has similarity to beta-glucosidases. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KL. The function of KL has been established by previous studies. In a population-based association study, Arking et al. (2002) determined that allele 17 of microsatellite marker 1, which is 11 kb 3-prime of the last exon of the KL gene, is significantly more prevalent in Bohemian Czech newborns than in individuals more than 75 years old, independent of sex and health status. SSCP analysis identified another KL allele, which the authors termed KL-VS, defined by the presence of 6 single-nucleotide polymorphisms (SNPs) in an 800-bp region spanning exon 2 and flanking sequence. Allele-specific oligonucleotide hy-

bridization analysis showed complete linkage disequilibrium for the coding region mutations. Of the 3 mutations in exon 2, 1 is silent and 2 encode amino acid changes, phe352 to val (F352V) and cys370 to ser (C370S). The F352V mutation occurs at a completely conserved amino acid. Genotype analysis indicated that heterozygosity for F352V is significantly more prevalent in elderly Bohemians than in newborns, while homozygosity for V352, which is rare, is more prevalent in newborns. Kaplan–Meier survival analysis revealed that the heterozygote advantage promotes not only survival but also longevity (OMIM Ref. No. 152430) in elderly individuals more than 80 years old. Analysis of Caucasians and African Americans in Baltimore did not detect a heterozygote advantage for F352V, but did find decreased V352 homozygosity in the elderly. Western blot analysis of expression of the V352, S370, V352/S370, and wildtype alleles in HeLa cells or fibroblasts showed enhanced secretion of S370 mutant and decreased secretion of V352 variant compared with the 65–kD wildtype protein. The double mutant was secreted at intermediate levels, and the V352 mutant was most abundant intracellularly, suggesting a KL secretion defect. Functional analysis of a KL paralog, cytosolic beta–

glucosidase (CBGL1; 606619), which has a known substrate, p-nitrophenyl-beta-D-glucoside, established that a mutation (F289V) at the position in CBGL1 corresponding to KL F352V results in a complete loss of ability to cleave the substrate. Arking et al. (2002) concluded that the KL-VS mutation impairs the trafficking and catalytic activity of KL, which may in turn contribute to differences in the onset and severity of age-related phenotypes. They also suggested that additional deleterious mutations remained to be identified, since KL-VS is found on multiple marker allele haplotypes and is negatively associated with marker 1 allele 17. Animal model experiments lend further support to the function of KL. Mori et al. (2000) showed that klotho mice had a barely detectable amount of white adipose tissue, whereas brown adipose tissue (BAT) was comparably preserved. Although klotho mice consumed as much food as wildtype mice when normalized for body weight, they exhibited changes in parameters for energy homeostasis similar to those found under food-restricted conditions. The klotho mice had increased glucose tolerance and insulin sensitivity, as well as increased hepatic Pepck (OMIM Ref. No. 261680) expression. Levels of uncoupling protein-1 (UCP1; 113730) and body temperature

were significantly lower in klotho mice. Histologic analysis demonstrated lower glycogen, insulin, and lipid in the liver, pancreas, and BAT, respectively

[58246] It is appreciated that the abovementioned animal model for KL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[58247] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58248] Mori, K.; Yahata, K.; Mukoyama, M.; Suganami, T.; Makino, H.; Nagae, T.; Masuzaki, H.; Ogawa, Y.; Sugawara, A.; Nabeshima, Y.; Nakao, K. : Disruption of klotho gene causes an abnormal energy homeostasis in mice. Biochem. Biophys. Res. Commun. 278: 665–670, 2000. ; and

[58249] Arking, D. E.; Krebsova, A.; Macek, M., Sr.; Macek, M., Jr.; Arking, A.; Mian, I. S.; Fried, L.; Hamosh, A.; Dey, S.; McIntosh, I.; Dietz, H. C. : Association of human aging with a func.

[58250] Further studies establishing the function and utilities of KL are found in John Hopkins OMIM database record ID 604824, and in cited publications numbered 5019–5024

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM\_021960) is another VGAM1730 host target gene. MCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:22490, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58251] Another function of VGAM1730 is therefore inhibition of Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM\_021960), a gene which involved in programming of differentiation and concomitant maintenance of viability. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1. The function of MCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1083. Mannosyl (alpha-1,3-)-glycoprotein Beta-

1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM\_002406) is another VGAM1730 host target gene. MGAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT1 BINDING SITE, designated SEQ ID:8229, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58252] Another function of VGAM1730 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT1, Accession NM\_002406), a gene which exists as a single protein-encoding exon. Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT1. The function of MGAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession

NM\_002408) is another VGAM1730 host target gene.

MGAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT2 BINDING SITE, designated SEQ ID:8235, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58253] Another function of VGAM1730 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,2-N-acetylglucosaminyltransferase (MGAT2, Accession NM\_002408). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT2. SET Translocation (myeloid leukemia-associated) (SET, Accession NM\_003011) is another VGAM1730 host target gene. SET BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SET BINDING SITE, designated SEQ ID:8923, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58254] Another function of VGAM1730 is therefore inhibition of SET Translocation (myeloid leukemia-associated) (SET, Accession NM\_003011). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SET. Angiomotin Like 1 (AMOTL1, Accession XM\_057045) is another VGAM1730 host target gene. AMOTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL1 BINDING SITE, designated SEQ ID:36470, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58255] Another function of VGAM1730 is therefore inhibition of Angiomotin Like 1 (AMOTL1, Accession XM\_057045). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL1. FLJ10901 (Accession

NM\_018265) is another VGAM1730 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20233, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58256] Another function of VGAM1730 is therefore inhibition of FLJ10901 (Accession NM\_018265). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10901. Nuclear Transcription Factor, X-box Binding 1 (NFX1, Accession NM\_002504) is another VGAM1730 host target gene. NFX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NFX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFX1 BINDING SITE, designated SEQ ID:8328, to the nucleotide sequence of VGAM1730 RNA,

herein designated VGAM RNA, also designated SEQ ID:4441.

[58257] Another function of VGAM1730 is therefore inhibition of Nuclear Transcription Factor, X-box Binding 1 (NFX1, Accession NM\_002504). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFX1. PRO1914 (Accession NM\_014106) is another VGAM1730 host target gene. PRO1914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1914 BINDING SITE, designated SEQ ID:15330, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58258] Another function of VGAM1730 is therefore inhibition of PRO1914 (Accession NM\_014106). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1914. PRO2000 (Accession NM\_014109) is another VGAM1730 host target gene. PRO2000 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO2000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2000 BINDING SITE, designated SEQ ID:15338, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58259] Another function of VGAM1730 is therefore inhibition of PRO2000 (Accession NM\_014109). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2000. LOC149722 (Accession XM\_097709) is another VGAM1730 host target gene. LOC149722 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149722 BINDING SITE, designated SEQ ID:41046, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58260] Another function of VGAM1730 is therefore inhibition of

LOC149722 (Accession XM\_097709). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149722. LOC152992 (Accession XM\_087575) is another VGAM1730 host target gene. LOC152992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152992 BINDING SITE, designated SEQ ID:39349, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58261] Another function of VGAM1730 is therefore inhibition of LOC152992 (Accession XM\_087575). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152992. LOC157663 (Accession XM\_088354) is another VGAM1730 host target gene. LOC157663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC157663 BINDING SITE, designated SEQ ID:39640, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58262] Another function of VGAM1730 is therefore inhibition of LOC157663 (Accession XM\_088354). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157663. LOC245771 (Accession XM\_167366) is another VGAM1730 host target gene. LOC245771 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44638, to the nucleotide sequence of VGAM1730 RNA, herein designated VGAM RNA, also designated SEQ ID:4441.

[58263] Another function of VGAM1730 is therefore inhibition of LOC245771 (Accession XM\_167366). Accordingly, utilities of VGAM1730 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245771. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1731 (VGAM1731) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58264] VGAM1731 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1731 was detected is described hereinabove with reference to Figs. 1–8.

[58265] VGAM1731 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58266] VGAM1731 gene encodes a VGAM1731 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1731 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1731 precursor RNA is designated SEQ ID:1717, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1717 is located at position 3422 relative to the

genome of Rabies Virus.

[58267] VGAM1731 precursor RNA folds onto itself, forming VGAM1731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58268] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1731 folded precursor RNA into VGAM1731 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1731 RNA is designated SEQ ID:4442, and is provided hereinbelow with reference to the sequence listing part.

[58269] VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1731 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[58270] VGAM1731 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1731 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1731 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58271] The complementary binding of VGAM1731 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1731 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1731 host target RNA into VGAM1731 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58272] It is appreciated that VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1731 host target genes. The mRNA of each one of this plurality of VGAM1731 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1731 RNA, herein designated VGAM RNA, and which when bound by VGAM1731 RNA causes inhibition of translation of respective one or more VGAM1731 host target proteins.

[58273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1731 gene, herein designated VGAM GENE, on one or more VGAM1731 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58274] It is yet further appreciated that a function of VGAM1731 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1731 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1731 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58275] Nucleotide sequences of the VGAM1731 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1731 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1731 are further described hereinbelow with reference to Table 1.

[58276] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1731 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1731 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58277] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1731 gene, herein designated VGAM is inhibition of expression of VGAM1731 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1731 correlate with, and may be deduced

from, the identity of the target genes which VGAM1731 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58278] Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM\_000131) is a VGAM1731 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:5604 and SEQ ID:21233 respectively, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58279] A function of VGAM1731 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM\_000131). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445) is another VGAM1731 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:22780, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58280] Another function of VGAM1731 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445), a gene which catalyzes the conversion of thiamine, a form of vitamin B1, to thiamine pyrophosphate . Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.DKFZP564M082 (Accession NM\_014042) is another VGAM1731 host target gene. DKFZP564M082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564M082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZP564M082 BINDING SITE, designated SEQ ID:15271, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58281] Another function of VGAM1731 is therefore inhibition of DKFZP564M082 (Accession NM\_014042). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564M082. FLJ13265 (Accession NM\_024877) is another VGAM1731 host target gene. FLJ13265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13265 BINDING SITE, designated SEQ ID:24312, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58282] Another function of VGAM1731 is therefore inhibition of FLJ13265 (Accession NM\_024877). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13265. HSU79303 (Accession NM\_013301) is another VGAM1731 host target gene. HSU79303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSU79303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSU79303 BINDING SITE, designated SEQ ID:14962, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58283] Another function of VGAM1731 is therefore inhibition of HSU79303 (Accession NM\_013301). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU79303. KIAA0472 (Accession XM\_050147) is another VGAM1731 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35574, to the nucleotide sequence of VGAM1731 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4442.

[58284] Another function of VGAM1731 is therefore inhibition of KIAA0472 (Accession XM\_050147). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA1237 (Accession XM\_087386) is another VGAM1731 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:39216, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58285] Another function of VGAM1731 is therefore inhibition of KIAA1237 (Accession XM\_087386). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. Paralemmin (PALM, Accession NM\_002579) is another VGAM1731 host target gene. PALM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PALM, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:8439, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58286] Another function of VGAM1731 is therefore inhibition of Paralemmin (PALM, Accession NM\_002579). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM. LOC152445 (Accession XM\_098231) is another VGAM1731 host target gene. LOC152445 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:41512, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58287] Another function of VGAM1731 is therefore inhibition of LOC152445 (Accession XM\_098231). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152445. LOC157247 (Accession XM\_088275) is another VGAM1731 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39578, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58288] Another function of VGAM1731 is therefore inhibition of LOC157247 (Accession XM\_088275). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. LOC219333 (Accession XM\_167944) is another VGAM1731 host target gene. LOC219333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219333 BINDING SITE, designated SEQ ID:44934, to

the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58289] Another function of VGAM1731 is therefore inhibition of LOC219333 (Accession XM\_167944). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219333. LOC58489 (Accession XM\_051862) is another VGAM1731 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35904, to the nucleotide sequence of VGAM1731 RNA, herein designated VGAM RNA, also designated SEQ ID:4442.

[58290] Another function of VGAM1731 is therefore inhibition of LOC58489 (Accession XM\_051862). Accordingly, utilities of VGAM1731 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1732 (VGAM1732) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58291] VGAM1732 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1732 was detected is described hereinabove with reference to Figs. 1–8.

[58292] VGAM1732 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58293] VGAM1732 gene encodes a VGAM1732 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1732 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1732 precursor RNA is designated SEQ ID:1718, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1718 is located at position 9788 relative to the genome of Rabies Virus.

[58294] VGAM1732 precursor RNA folds onto itself, forming

VGAM1732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58295] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1732 folded precursor RNA into VGAM1732 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1732 RNA is designated SEQ ID:4443, and is provided hereinbelow with reference to the sequence listing part.

[58296] VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1732 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58297] VGAM1732 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1732 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1732 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58298] The complementary binding of VGAM1732 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1732 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1732 host target RNA into VGAM1732 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58299] It is appreciated that VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1732 host target genes. The mRNA of each one of this plurality of VGAM1732 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1732 RNA, herein designated VGAM RNA, and which when bound by VGAM1732 RNA causes inhibition of translation of respective one or more VGAM1732 host target proteins.

[58300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1732 gene, herein designated VGAM GENE, on one or more VGAM1732 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58301] It is yet further appreciated that a function of VGAM1732 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM1732 correlate with, and may be deduced from, the identity of the host target genes which VGAM1732 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[58302] Nucleotide sequences of the VGAM1732 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1732 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1732 are further described hereinbelow with reference to Table 1.

[58303] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM1732 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1732 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58304] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1732 gene, herein designated VGAM is inhibition of expression of VGAM1732 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1732 correlate with, and may be deduced from, the identity of the target genes which VGAM1732 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[58305] Paired Mesoderm Homeo Box 1 (PMX1, Accession NM\_006902) is a VGAM1732 host target gene. PMX1 BINDING SITE1 and PMX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PMX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2, designated SEQ ID:13776 and SEQ ID:22911 respectively, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58306] A function of VGAM1732 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM\_006902), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.CDP-diacylglycerol--inositol

3-phosphatidyltransferase (phosphatidylinositol synthase) (CDIPT, Accession NM\_006319) is another VGAM1732 host target gene. CDIPT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDIPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDIPT BINDING SITE, designated SEQ ID:13008, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58307] Another function of VGAM1732 is therefore inhibition of CDP-diacylglycerol--inositol 3-phosphatidyltransferase (phosphatidylinositol synthase) (CDIPT, Accession NM\_006319). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDIPT. DJ328E19.C1.1 (Accession NM\_015383) is another VGAM1732 host target gene. DJ328E19.C1.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ328E19.C1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of DJ328E19.C1.1 BINDING SITE, designated SEQ ID:17682, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58308] Another function of VGAM1732 is therefore inhibition of DJ328E19.C1.1 (Accession NM\_015383). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ328E19.C1.1. KIAA0408 (Accession NM\_014702) is another VGAM1732 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16229, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58309] Another function of VGAM1732 is therefore inhibition of KIAA0408 (Accession NM\_014702). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. KIAA1005 (Accession XM\_051197) is another

VGAM1732 host target gene. KIAA1005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1005 BINDING SITE, designated SEQ ID:35776, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58310] Another function of VGAM1732 is therefore inhibition of KIAA1005 (Accession XM\_051197). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1005. KIAA1255 (Accession XM\_040626) is another VGAM1732 host target gene. KIAA1255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1255 BINDING SITE, designated SEQ ID:33344, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58311] Another function of VGAM1732 is therefore inhibition of KIAA1255 (Accession XM\_040626). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1255. NBR2 (Accession NM\_005821) is another VGAM1732 host target gene. NBR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBR2 BINDING SITE, designated SEQ ID:12423, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58312] Another function of VGAM1732 is therefore inhibition of NBR2 (Accession NM\_005821). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBR2. RAB14, Member RAS Oncogene Family (RAB14, Accession NM\_016322) is another VGAM1732 host target gene. RAB14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB14, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB14 BINDING SITE, designated SEQ ID:18446, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58313] Another function of VGAM1732 is therefore inhibition of RAB14, Member RAS Oncogene Family (RAB14, Accession NM\_016322). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB14. LOC137362 (Accession XM\_059905) is another VGAM1732 host target gene. LOC137362 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC137362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137362 BINDING SITE, designated SEQ ID:37105, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58314] Another function of VGAM1732 is therefore inhibition of LOC137362 (Accession XM\_059905). Accordingly, utilities

of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137362. LOC203025 (Accession XM\_114610) is another VGAM1732 host target gene. LOC203025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203025 BINDING SITE, designated SEQ ID:43000, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58315] Another function of VGAM1732 is therefore inhibition of LOC203025 (Accession XM\_114610). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203025. LOC90643 (Accession XM\_033145) is another VGAM1732 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90643 BINDING SITE, designated SEQ ID:31850, to the nucleotide sequence of VGAM1732 RNA, herein designated VGAM RNA, also designated SEQ ID:4443.

[58316] Another function of VGAM1732 is therefore inhibition of LOC90643 (Accession XM\_033145). Accordingly, utilities of VGAM1732 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1733 (VGAM1733) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58317] VGAM1733 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1733 was detected is described hereinabove with reference to Figs. 1–8.

[58318] VGAM1733 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58319] VGAM1733 gene encodes a VGAM1733 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1733 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1733 precursor RNA is designated SEQ ID:1719, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1719 is located at position 40756 relative to the genome of Human Herpesvirus 3.

[58320] VGAM1733 precursor RNA folds onto itself, forming VGAM1733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58321] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1733 folded precursor RNA into VGAM1733 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1733 RNA is designated SEQ ID:4444, and is provided hereinbelow with reference to the sequence listing part.

[58322] VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1733 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58323] VGAM1733 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1733 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1733 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58324] The complementary binding of VGAM1733 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1733 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1733 host target RNA into VGAM1733 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58325] It is appreciated that VGAM1733 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1733 host target genes. The mRNA of each one of this plurality of VGAM1733 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1733 RNA, herein designated VGAM RNA, and which when bound by VGAM1733 RNA causes inhibition of translation of respective one or more VGAM1733 host target proteins.

[58326] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1733 gene, herein designated VGAM GENE, on one or more VGAM1733 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58327] It is yet further appreciated that a function of VGAM1733 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1733 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1733 correlate with, and may be deduced from, the identity of the host target genes which VGAM1733 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58328] Nucleotide sequences of the VGAM1733 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1733 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1733 are further described hereinbelow with reference to Table 1.

[58329] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1733 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1733 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58330] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1733 gene, herein designated VGAM is inhibition of expression of VGAM1733 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1733 correlate with, and may be deduced from, the identity of the target genes which VGAM1733 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58331] Down-regulator of Transcription 1, TBP-binding (negative cofactor 2) (DR1, Accession XM\_002015) is a VGAM1733 host target gene. DR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DR1 BINDING SITE, designated SEQ ID:29857, to the nucleotide sequence of VGAM1733 RNA, herein designated VGAM RNA, also designated SEQ ID:4444.

[58332] A function of VGAM1733 is therefore inhibition of Down-regulator of Transcription 1, TBP-binding (negative cofactor 2) (DR1, Accession XM\_002015), a gene which influences functional repression of both activated and basal transcription of class ii genes. Accordingly, utilities of VGAM1733 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DR1. The function of DR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM711. Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM\_054111) is another VGAM1733 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IHPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK3 BINDING SITE, designated SEQ ID:27656, to the nucleotide sequence of VGAM1733 RNA, herein designated VGAM RNA, also designated SEQ ID:4444.

[58333] Another function of VGAM1733 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM\_054111). Accordingly, utilities of VGAM1733 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. LOC123036 (Accession XM\_058676) is another VGAM1733 host target gene. LOC123036 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123036 BINDING SITE, designated SEQ ID:36716, to the nucleotide sequence of VGAM1733 RNA, herein designated VGAM RNA, also designated SEQ ID:4444.

[58334] Another function of VGAM1733 is therefore inhibition of LOC123036 (Accession XM\_058676). Accordingly, utilities of VGAM1733 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123036. LOC144962 (Accession XM\_084990) is another VGAM1733 host target gene. LOC144962 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC144962 BINDING SITE, designated SEQ ID:37790, to the nucleotide sequence of VGAM1733 RNA, herein designated VGAM RNA, also designated SEQ ID:4444.

[58335] Another function of VGAM1733 is therefore inhibition of LOC144962 (Accession XM\_084990). Accordingly, utilities of VGAM1733 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144962. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1734 (VGAM1734) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58336] VGAM1734 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1734 was detected is described hereinabove with reference to Figs. 1–8.

[58337] VGAM1734 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1734 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58338] VGAM1734 gene encodes a VGAM1734 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1734 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1734 precursor RNA is designated SEQ ID:1720, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1720 is located at position 35482 relative to the genome of Human Herpesvirus 3.

[58339] VGAM1734 precursor RNA folds onto itself, forming VGAM1734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58340] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1734 folded precursor RNA into VGAM1734 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1734 RNA is designated SEQ ID:4445, and is provided hereinbelow with reference to the sequence listing part.

[58341] VGAM1734 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1734 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58342] VGAM1734 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1734 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1734 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58343] The complementary binding of VGAM1734 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1734 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1734 host target RNA into VGAM1734 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58344] It is appreciated that VGAM1734 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1734 host target genes. The mRNA of each one of this plurality of VGAM1734 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1734 RNA, herein designated VGAM RNA, and which when bound by VGAM1734 RNA causes inhibition of translation of respective one or more VGAM1734 host target proteins.

[58345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1734 gene, herein designated VGAM GENE, on one or more VGAM1734 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[58346] It is yet further appreciated that a function of VGAM1734 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1734 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1734 correlate with, and may be deduced from, the identity of the host target genes which VGAM1734 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58347] Nucleotide sequences of the VGAM1734 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1734 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1734 are further described hereinbelow with reference to Table 1.

[58348] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1734 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1734 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58349] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1734 gene, herein designated VGAM is inhibition of expression of VGAM1734 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1734 correlate with, and may be deduced from, the identity of the target genes which VGAM1734 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58350] Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609) is a VGAM1734 host target gene. ACADSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:7317, to the nucleotide sequence of VGAM1734 RNA, herein designated VGAM RNA, also designated SEQ ID:4445.

[58351] A function of VGAM1734 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609). Accordingly, utilities of VGAM1734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. FLJ20331 (Accession NM\_017768) is another VGAM1734 host target gene. FLJ20331 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20331 BINDING SITE, designated SEQ ID:19385, to the nucleotide sequence of VGAM1734 RNA, herein designated VGAM RNA, also designated SEQ ID:4445.

[58352] Another function of VGAM1734 is therefore inhibition of FLJ20331 (Accession NM\_017768). Accordingly, utilities of VGAM1734 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20331. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1735 (VGAM1735) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58353] VGAM1735 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1735 was detected is described hereinabove with reference to Figs. 1–8.

[58354] VGAM1735 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58355] VGAM1735 gene encodes a VGAM1735 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1735 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1735 precursor RNA is designated SEQ ID:1721, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1721 is located at position 33659 relative to the genome of Human Herpesvirus 3.

[58356] VGAM1735 precursor RNA folds onto itself, forming

VGAM1735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58357] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1735 folded precursor RNA into VGAM1735 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1735 RNA is designated SEQ ID:4446, and is provided hereinbelow with reference to the sequence listing part.

[58358] VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1735 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58359] VGAM1735 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1735 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1735 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58360] The complementary binding of VGAM1735 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1735 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1735 host target RNA into VGAM1735 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58361] It is appreciated that VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1735 host target genes. The mRNA of each one of this plurality of VGAM1735 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1735 RNA, herein designated VGAM RNA, and which when bound by VGAM1735 RNA causes inhibition of translation of respective one or more VGAM1735 host target proteins.

[58362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1735 gene, herein designated VGAM GENE, on one or more VGAM1735 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58363] It is yet further appreciated that a function of VGAM1735 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1735 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1735 correlate with, and may be deduced from, the identity of the host target genes which VGAM1735 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[58364] Nucleotide sequences of the VGAM1735 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1735 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1735 are further described hereinbelow with reference to Table 1.

[58365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1735 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1735 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58366] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1735 gene, herein designated VGAM is inhibition of expression of VGAM1735 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1735 correlate with, and may be deduced from, the identity of the target genes which VGAM1735 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[58367] MSTP032 (Accession NM\_025226) is a VGAM1735 host target gene. MSTP032 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24904, to the nucleotide sequence of VGAM1735 RNA, herein designated VGAM RNA, also designated SEQ ID:4446.

[58368] A function of VGAM1735 is therefore inhibition of MSTP032 (Accession NM\_025226). Accordingly, utilities of VGAM1735 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM\_013257) is another VGAM1735 host target gene. SGKL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SGKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGKL BINDING SITE, designated SEQ

ID:14927, to the nucleotide sequence of VGAM1735 RNA, herein designated VGAM RNA, also designated SEQ ID:4446.

[58369] Another function of VGAM1735 is therefore inhibition of Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM\_013257). Accordingly, utilities of VGAM1735 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGKL. LOC149401 (Accession XM\_086511) is another VGAM1735 host target gene. LOC149401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149401 BINDING SITE, designated SEQ ID:38736, to the nucleotide sequence of VGAM1735 RNA, herein designated VGAM RNA, also designated SEQ ID:4446.

[58370] Another function of VGAM1735 is therefore inhibition of LOC149401 (Accession XM\_086511). Accordingly, utilities of VGAM1735 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149401. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1736 (VGAM1736) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58371] VGAM1736 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1736 was detected is described hereinabove with reference to Figs. 1–8.

[58372] VGAM1736 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58373] VGAM1736 gene encodes a VGAM1736 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1736 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1736 precursor RNA is designated SEQ ID:1722, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1722 is located at position 39181 relative to the genome of Human Herpesvirus 3.

[58374] VGAM1736 precursor RNA folds onto itself, forming VGAM1736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58375] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1736 folded precursor RNA into VGAM1736 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1736 RNA is designated SEQ ID:4447, and is provided hereinbelow with reference to the sequence listing part.

[58376] VGAM1736 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1736 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58377] VGAM1736 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1736 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1736 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1736 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[58378] The complementary binding of VGAM1736 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1736 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1736 host target RNA into VGAM1736 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58379] It is appreciated that VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1736 host target genes. The mRNA of each one of this plurality of VGAM1736 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1736 RNA, herein designated VGAM RNA, and which when bound by VGAM1736 RNA causes inhibition of translation of respective one or more

VGAM1736 host target proteins.

[58380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1736 gene, herein designated VGAM GENE, on one or more VGAM1736 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58381] It is yet further appreciated that a function of VGAM1736 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Spe-

cific functions, and accordingly utilities, of VGAM1736 correlate with, and may be deduced from, the identity of the host target genes which VGAM1736 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58382] Nucleotide sequences of the VGAM1736 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1736 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1736 are further described hereinbelow with reference to Table 1.

[58383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1736 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1736 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58384] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1736 gene, herein designated VGAM is inhibition of expression of VGAM1736 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1736 correlate with, and may be deduced from, the identity of the target genes which VGAM1736 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58385] F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM\_012158) is a VGAM1736 host target gene. FBXL3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL3A BINDING SITE, designated SEQ ID:14455, to the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, also designated SEQ ID:4447.

[58386] A function of VGAM1736 is therefore inhibition of F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM\_012158), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL3A. The function of FBXL3A and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM1172. Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062) is another VGAM1736 host target gene. GLP1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP1R BINDING SITE, designated SEQ ID:7829, to the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, also designated SEQ ID:4447.

[58387] Another function of VGAM1736 is therefore inhibition of Glucagon-like Peptide 1 Receptor (GLP1R, Accession NM\_002062), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP1R. The function of GLP1R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1652. Transcription Factor 8 (represses interleukin 2 expression) (TCF8, Accession NM\_030751) is an-

other VGAM1736 host target gene. TCF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF8 BINDING SITE, designated SEQ ID:25039, to the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, also designated SEQ ID:4447.

[58388] Another function of VGAM1736 is therefore inhibition of Transcription Factor 8 (represses interleukin 2 expression) (TCF8, Accession NM\_030751), a gene which may be responsible for transcriptional repression of the il-2 gene and regulates the promoter activity of the atp1a1 gene . Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF8. The function of TCF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM166. G-rich RNA Sequence Binding Factor 1 (GRSF1, Accession NM\_002092) is another VGAM1736 host target gene. GRSF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by GRSF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRSF1 BINDING SITE, designated SEQ ID:7881, to the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, also designated SEQ ID:4447.

[58389] Another function of VGAM1736 is therefore inhibition of G-rich RNA Sequence Binding Factor 1 (GRSF1, Accession NM\_002092). Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRSF1. KIAA0416 (Accession NM\_015564) is another VGAM1736 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17840, to the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, also designated SEQ ID:4447.

[58390] Another function of VGAM1736 is therefore inhibition of

KIAA0416 (Accession NM\_015564). Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. SCDGF-B (Accession NM\_025208) is another VGAM1736 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:24878 and SEQ ID:26980 respectively, to the nucleotide sequence of VGAM1736 RNA, herein designated VGAM RNA, also designated SEQ ID:4447.

[58391] Another function of VGAM1736 is therefore inhibition of SCDGF-B (Accession NM\_025208). Accordingly, utilities of VGAM1736 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1737 (VGAM1737) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58392] VGAM1737 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1737 was detected is described hereinabove with reference to Figs. 1–8.

[58393] VGAM1737 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58394] VGAM1737 gene encodes a VGAM1737 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1737 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1737 precursor RNA is designated SEQ ID:1723, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1723 is located at position 32691 relative to the genome of Human Herpesvirus 3.

[58395] VGAM1737 precursor RNA folds onto itself, forming

VGAM1737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58396] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1737 folded precursor RNA into VGAM1737 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1737 RNA is designated SEQ ID:4448, and is provided hereinbelow with reference to the sequence listing part.

[58397] VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1737 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58398] VGAM1737 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1737 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1737 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58399] The complementary binding of VGAM1737 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1737 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1737 host target RNA into VGAM1737 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58400] It is appreciated that VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1737 host target genes. The mRNA of each one of this plurality of VGAM1737 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1737 RNA, herein designated VGAM RNA, and which when bound by VGAM1737 RNA causes inhibition of translation of respective one or more VGAM1737 host target proteins.

[58401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1737 gene, herein designated VGAM GENE, on one or more VGAM1737 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58402] It is yet further appreciated that a function of VGAM1737 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1737 correlate with, and may be deduced from, the identity of the host target genes which VGAM1737 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[58403] Nucleotide sequences of the VGAM1737 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1737 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1737 are further described hereinbelow with reference to Table 1.

[58404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1737 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1737 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58405] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1737 gene, herein designated VGAM is inhibition of expression of VGAM1737 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1737 correlate with, and may be deduced from, the identity of the target genes which VGAM1737 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[58406] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141) is a VGAM1737 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15417, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58407] A function of VGAM1737 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM\_012308) is another VGAM1737 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ ID:14678, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58408] Another function of VGAM1737 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM\_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404. Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424) is another VGAM1737 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE,

designated SEQ ID:44314, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58409] Another function of VGAM1737 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. FLJ11850 (Accession NM\_022741) is another VGAM1737 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22947, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58410] Another function of VGAM1737 is therefore inhibition of FLJ11850 (Accession NM\_022741). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850. KIAA0255 (Accession NM\_014742) is another

VGAM1737 host target gene. KIAA0255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0255 BINDING SITE, designated SEQ ID:16415, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58411] Another function of VGAM1737 is therefore inhibition of KIAA0255 (Accession NM\_014742). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0255. RAN Binding Protein 6 (RANBP6, Accession XM\_029423) is another VGAM1737 host target gene. RANBP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RANBP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP6 BINDING SITE, designated SEQ ID:30884, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ

ID:4448.

[58412] Another function of VGAM1737 is therefore inhibition of RAN Binding Protein 6 (RANBP6, Accession XM\_029423). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP6. LOC157798 (Accession XM\_098827) is another VGAM1737 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:41847, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58413] Another function of VGAM1737 is therefore inhibition of LOC157798 (Accession XM\_098827). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC221715 (Accession XM\_168092) is another VGAM1737 host target gene. LOC221715 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC221715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221715 BINDING SITE, designated SEQ ID:45016, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58414] Another function of VGAM1737 is therefore inhibition of LOC221715 (Accession XM\_168092). Accordingly, utilities of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221715. LOC254659 (Accession XM\_170822) is another VGAM1737 host target gene. LOC254659 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254659 BINDING SITE, designated SEQ ID:45600, to the nucleotide sequence of VGAM1737 RNA, herein designated VGAM RNA, also designated SEQ ID:4448.

[58415] Another function of VGAM1737 is therefore inhibition of LOC254659 (Accession XM\_170822). Accordingly, utilities

of VGAM1737 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254659. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1738 (VGAM1738) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58416] VGAM1738 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1738 was detected is described hereinabove with reference to Figs. 1-8.

[58417] VGAM1738 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58418] VGAM1738 gene encodes a VGAM1738 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1738 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1738 precursor RNA is designated SEQ ID:1724, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1724 is located at position 41710 relative to the genome of Human Herpesvirus 3.

[58419] VGAM1738 precursor RNA folds onto itself, forming VGAM1738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58420] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1738 folded precursor RNA into VGAM1738 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1738 RNA is designated SEQ ID:4449, and

is provided hereinbelow with reference to the sequence listing part.

[58421] VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1738 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[58422] VGAM1738 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1738 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1738 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58423] The complementary binding of VGAM1738 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1738 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1738 host target RNA into VGAM1738 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58424] It is appreciated that VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1738 host target genes. The mRNA of each one of this plurality of VGAM1738 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1738 RNA, herein designated VGAM RNA, and which when bound by VGAM1738 RNA causes inhibition of translation of respective one or more VGAM1738 host target proteins.

[58425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1738 gene, herein designated VGAM GENE, on one or more VGAM1738 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58426] It is yet further appreciated that a function of VGAM1738 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1738 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1738 correlate with, and may be deduced from, the identity of the host target genes which VGAM1738 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58427] Nucleotide sequences of the VGAM1738 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1738 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1738 are further described hereinbelow with reference to Table 1.

[58428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1738 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1738 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58429] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1738 gene, herein designated VGAM is inhibition of expression of VGAM1738 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1738 correlate with, and may be deduced from, the identity of the target genes which VGAM1738 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58430] Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM\_001393) is a VGAM1738 host target gene. ECM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ECM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECM2 BINDING SITE, designated SEQ ID:7086, to the nucleotide sequence of VGAM1738 RNA, herein designated VGAM RNA, also designated SEQ ID:4449.

[58431] A function of VGAM1738 is therefore inhibition of Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM\_001393). Accordingly, utilities of VGAM1738 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ECM2. Epsin 2 (EPN2, Accession NM\_014964) is another VGAM1738 host target gene. EPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPN2 BINDING SITE, designated SEQ ID:17344, to the nucleotide sequence of VGAM1738 RNA, herein designated VGAM RNA, also designated SEQ ID:4449.

[58432] Another function of VGAM1738 is therefore inhibition of Epsin 2 (EPN2, Accession NM\_014964). Accordingly, utilities of VGAM1738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN2. RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662) is another VGAM1738 host target gene. RAB39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:37643, to the nucleotide sequence of VGAM1738 RNA,

herein designated VGAM RNA, also designated SEQ ID:4449.

[58433] Another function of VGAM1738 is therefore inhibition of RAB39, Member RAS Oncogene Family (RAB39, Accession XM\_084662). Accordingly, utilities of VGAM1738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39. LOC151473 (Accession XM\_087215) is another VGAM1738 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39118, to the nucleotide sequence of VGAM1738 RNA, herein designated VGAM RNA, also designated SEQ ID:4449.

[58434] Another function of VGAM1738 is therefore inhibition of LOC151473 (Accession XM\_087215). Accordingly, utilities of VGAM1738 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1739 (VGAM1739) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58435] VGAM1739 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1739 was detected is described hereinabove with reference to Figs. 1–8.

[58436] VGAM1739 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58437] VGAM1739 gene encodes a VGAM1739 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1739 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1739 precursor RNA is designated SEQ ID:1725, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1725 is located at position 38932 relative to the

genome of Human Herpesvirus 3.

[58438] VGAM1739 precursor RNA folds onto itself, forming VGAM1739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58439] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1739 folded precursor RNA into VGAM1739 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1739 RNA is designated SEQ ID:4450, and is provided hereinbelow with reference to the sequence listing part.

[58440] VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1739 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[58441] VGAM1739 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1739 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1739 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58442] The complementary binding of VGAM1739 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1739 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1739 host target RNA into VGAM1739 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58443] It is appreciated that VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1739 host target genes. The mRNA of each one of this plurality of VGAM1739 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1739 RNA, herein designated VGAM RNA, and which when bound by VGAM1739 RNA causes inhibition of translation of respective one or more VGAM1739 host target proteins.

[58444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1739 gene, herein designated VGAM GENE, on one or more VGAM1739 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58445] It is yet further appreciated that a function of VGAM1739 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1739

correlate with, and may be deduced from, the identity of the host target genes which VGAM1739 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58446] Nucleotide sequences of the VGAM1739 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1739 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1739 are further described hereinbelow with reference to Table 1.

[58447] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1739 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1739 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58448] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1739 gene, herein designated VGAM is inhibition of expression of VGAM1739 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1739 correlate with, and may be deduced

from, the identity of the target genes which VGAM1739 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58449] ADP-ribosylation Factor 4-like (ARF4L, Accession XM\_045890) is a VGAM1739 host target gene. ARF4L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF4L BINDING SITE, designated SEQ ID:34603, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58450] A function of VGAM1739 is therefore inhibition of ADP-ribosylation Factor 4-like (ARF4L, Accession XM\_045890). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF4L. Copine III (CPNE3, Accession NM\_003909) is another VGAM1739 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:9993, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58451] Another function of VGAM1739 is therefore inhibition of Copine III (CPNE3, Accession NM\_003909), a gene which may function in membrane trafficking. Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806) is another VGAM1739 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31143, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58452] Another function of VGAM1739 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806), a gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM416. SMURF1 (Accession XM\_166483) is another VGAM1739 host target gene. SMURF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:44413, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58453] Another function of VGAM1739 is therefore inhibition of SMURF1 (Accession XM\_166483). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SMURF1. Forkhead Box J1 (FOXJ1, Accession NM\_001454) is another VGAM1739 host target gene. FOXJ1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOXJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXJ1 BINDING SITE, designated SEQ ID:7188, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58454] Another function of VGAM1739 is therefore inhibition of Forkhead Box J1 (FOXJ1, Accession NM\_001454). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXJ1. GRO3 (Accession XM\_031287) is another VGAM1739 host target gene. GRO3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRO3 BINDING SITE, designated SEQ ID:31334, to the nucleotide sequence of

VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58455] Another function of VGAM1739 is therefore inhibition of GRO3 (Accession XM\_031287). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRO3. Hippocalcin Like 4 (HPCAL4, Accession NM\_016257) is another VGAM1739 host target gene. HPCAL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPCAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL4 BINDING SITE, designated SEQ ID:18386, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58456] Another function of VGAM1739 is therefore inhibition of Hippocalcin Like 4 (HPCAL4, Accession NM\_016257). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL4. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM\_014424) is another VGAM1739 host target gene.

HSPB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:15779, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58457] Another function of VGAM1739 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM\_014424). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPB7. HSPC144 (Accession NM\_014174) is another VGAM1739 host target gene. HSPC144 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC144 BINDING SITE, designated SEQ ID:15462, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM

RNA, also designated SEQ ID:4450.

[58458] Another function of VGAM1739 is therefore inhibition of HSPC144 (Accession NM\_014174). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC144. KIAA0433 (Accession NM\_015216) is another VGAM1739 host target gene. KIAA0433 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0433 BINDING SITE, designated SEQ ID:17550, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58459] Another function of VGAM1739 is therefore inhibition of KIAA0433 (Accession NM\_015216). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0433. KIAA1084 (Accession NM\_014910) is another VGAM1739 host target gene. KIAA1084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1084, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1084 BINDING SITE, designated SEQ ID:17137, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58460] Another function of VGAM1739 is therefore inhibition of KIAA1084 (Accession NM\_014910). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1084. LOC90750 (Accession XM\_033868) is another VGAM1739 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31965, to the nucleotide sequence of VGAM1739 RNA, herein designated VGAM RNA, also designated SEQ ID:4450.

[58461] Another function of VGAM1739 is therefore inhibition of LOC90750 (Accession XM\_033868). Accordingly, utilities of VGAM1739 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1740 (VGAM1740) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58462] VGAM1740 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1740 was detected is described hereinabove with reference to Figs. 1–8.

[58463] VGAM1740 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58464] VGAM1740 gene encodes a VGAM1740 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1740 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1740 precursor RNA is desig-

nated SEQ ID:1726, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1726 is located at position 36839 relative to the genome of Human Herpesvirus 3.

- [58465] VGAM1740 precursor RNA folds onto itself, forming VGAM1740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58466] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1740 folded precursor RNA into VGAM1740 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1740 RNA is designated SEQ ID:4451, and is provided hereinbelow with reference to the sequence

listing part.

[58467] VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1740 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58468] VGAM1740 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1740 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1740 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58469] The complementary binding of VGAM1740 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1740 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1740 host target RNA into VGAM1740 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58470] It is appreciated that VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1740 host target genes. The mRNA of each one of this plurality of VGAM1740 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1740 RNA, herein designated VGAM

RNA, and which when bound by VGAM1740 RNA causes inhibition of translation of respective one or more VGAM1740 host target proteins.

[58471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1740 gene, herein designated VGAM GENE, on one or more VGAM1740 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58472] It is yet further appreciated that a function of VGAM1740 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1740 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1740 correlate with, and may be deduced from, the identity of the host target genes which VGAM1740 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58473] Nucleotide sequences of the VGAM1740 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1740 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1740 are further described hereinbelow with reference to Table 1.

[58474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1740 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1740 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58475] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1740 gene, herein designated VGAM is

inhibition of expression of VGAM1740 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1740 correlate with, and may be deduced from, the identity of the target genes which VGAM1740 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58476] Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493) is a VGAM1740 host target gene. CLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN5 BINDING SITE, designated SEQ ID:13233, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58477] A function of VGAM1740 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 5 (CLN5, Accession NM\_006493). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN5. COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375) is another VGAM1740 host target gene.

COX11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX11 BINDING SITE, designated SEQ ID:10597, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58478] Another function of VGAM1740 is therefore inhibition of COX11 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX11, Accession NM\_004375). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX11. SON DNA Binding Protein (SON, Accession NM\_138926) is another VGAM1740 host target gene. SON BINDING SITE1 through SON BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SON, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SON BINDING SITE1 through SON BINDING SITE3, designated SEQ ID:29043,

SEQ ID:27747 and SEQ ID:29047 respectively, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58479] Another function of VGAM1740 is therefore inhibition of SON DNA Binding Protein (SON, Accession NM\_138926). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SON. X-box Binding Protein 1 (XBP1, Accession NM\_005080) is another VGAM1740 host target gene. XBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XBP1 BINDING SITE, designated SEQ ID:11532, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58480] Another function of VGAM1740 is therefore inhibition of X-box Binding Protein 1 (XBP1, Accession NM\_005080), a gene which has a role in transcriptional regulation. Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XBP1. The function of XBP1 and its associ-

ation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM746.DJ37E16.5 (Accession NM\_020315) is another VGAM1740 host target gene.

DJ37E16.5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ37E16.5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ37E16.5 BINDING SITE, designated SEQ ID:21574, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58481] Another function of VGAM1740 is therefore inhibition of DJ37E16.5 (Accession NM\_020315). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ37E16.5. KIAA1456 (Accession XM\_040100) is another VGAM1740 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33266, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58482] Another function of VGAM1740 is therefore inhibition of KIAA1456 (Accession XM\_040100). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456. TUCAN (Accession NM\_014959) is another VGAM1740 host target gene. TUCAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUCAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:17321, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58483] Another function of VGAM1740 is therefore inhibition of TUCAN (Accession NM\_014959). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN. LOC158310 (Accession XM\_098919) is another

VGAM1740 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41950, to the nucleotide sequence of VGAM1740 RNA, herein designated VGAM RNA, also designated SEQ ID:4451.

[58484] Another function of VGAM1740 is therefore inhibition of LOC158310 (Accession XM\_098919). Accordingly, utilities of VGAM1740 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1741 (VGAM1741) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58485] VGAM1741 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1741 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[58486] VGAM1741 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58487] VGAM1741 gene encodes a VGAM1741 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1741 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1741 precursor RNA is designated SEQ ID:1727, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1727 is located at position 36070 relative to the genome of Cercopithecine Herpesvirus 7.

[58488] VGAM1741 precursor RNA folds onto itself, forming VGAM1741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58489] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1741 folded precursor RNA into VGAM1741 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1741 RNA is designated SEQ ID:4452, and is provided hereinbelow with reference to the sequence listing part.

[58490] VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1741 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58491] VGAM1741 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1741 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1741 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1741 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58492] The complementary binding of VGAM1741 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1741 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1741 host target RNA into VGAM1741 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58493] It is appreciated that VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1741 host target genes. The mRNA of each one of this plurality of VGAM1741 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1741 RNA, herein designated VGAM RNA, and which when bound by VGAM1741 RNA causes inhibition of translation of respective one or more VGAM1741 host target proteins.

[58494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1741 gene, herein designated VGAM GENE, on one or more VGAM1741 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58495] It is yet further appreciated that a function of VGAM1741 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1741 correlate with, and may be deduced from, the identity of the host target genes which VGAM1741 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58496] Nucleotide sequences of the VGAM1741 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1741 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1741 are further described hereinbelow with reference to Table 1.

[58497] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1741 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1741 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58498] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1741 gene, herein designated VGAM is inhibition of expression of VGAM1741 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1741 correlate with, and may be deduced from, the identity of the target genes which VGAM1741 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58499] 1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession XM\_038030) is a VGAM1741 host target gene. AGPAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AG-

PAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGPAT2 BINDING SITE, designated SEQ ID:32744, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58500] A function of VGAM1741 is therefore inhibition of 1-acylglycerol-3-phosphate O-acyltransferase 2 (lysophosphatidic acid acyltransferase, beta) (AGPAT2, Accession XM\_038030). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGPAT2. Ectonucleoside Triphosphate Diphosphohydrolase 3 (ENTPD3, Accession NM\_001248) is another VGAM1741 host target gene. ENTPD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENTPD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENTPD3 BINDING SITE, designated SEQ ID:6922, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ

ID:4452.

[58501] Another function of VGAM1741 is therefore inhibition of Ectonucleoside Triphosphate Diphosphohydrolase 3 (ENTPD3, Accession NM\_001248). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENTPD3. Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM\_014268) is another VGAM1741 host target gene. MAPRE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE2 BINDING SITE, designated SEQ ID:15548, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58502] Another function of VGAM1741 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM\_014268), a gene which The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MAPRE2. The function of MAPRE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Syntrophin, Beta 2 (dystrophin-associated protein A1, 59kDa, basic component 2) (SNTB2, Accession NM\_130845) is another VGAM1741 host target gene. SNTB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTB2 BINDING SITE, designated SEQ ID:28379, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58503] Another function of VGAM1741 is therefore inhibition of Syntrophin, Beta 2 (dystrophin-associated protein A1, 59kDa, basic component 2) (SNTB2, Accession NM\_130845). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTB2. Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM\_024701)

is another VGAM1741 host target gene. ASB13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB13 BINDING SITE, designated SEQ ID:24013, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58504] Another function of VGAM1741 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM\_024701). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB13. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536) is another VGAM1741 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10887, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA,

also designated SEQ ID:4452.

[58505] Another function of VGAM1741 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. CLIPR-59 (Accession NM\_015526) is another VGAM1741 host target gene. CLIPR-59 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIPR-59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIPR-59 BINDING SITE, designated SEQ ID:17787, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58506] Another function of VGAM1741 is therefore inhibition of CLIPR-59 (Accession NM\_015526). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59. KIAA1084 (Accession NM\_014910) is another VGAM1741 host target gene. KIAA1084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1084 BINDING SITE, designated SEQ ID:17135, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58507] Another function of VGAM1741 is therefore inhibition of KIAA1084 (Accession NM\_014910). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1084. OBTP (Accession NM\_017601) is another VGAM1741 host target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OBTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19082, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58508] Another function of VGAM1741 is therefore inhibition of OBTP (Accession NM\_017601). Accordingly, utilities of

VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBTP. Rpo1-2 (Accession NM\_032212) is another VGAM1741 host target gene. Rpo1-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rpo1-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE, designated SEQ ID:25932, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58509] Another function of VGAM1741 is therefore inhibition of Rpo1-2 (Accession NM\_032212). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. SPBPBP (Accession NM\_006692) is another VGAM1741 host target gene. SPBPBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPBPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPBPBP BIND-

ING SITE, designated SEQ ID:13509, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58510] Another function of VGAM1741 is therefore inhibition of SPBPBP (Accession NM\_006692). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPBPBP. Testis-specific Transcript, Y-linked 9 (TTY9, Accession NM\_031927) is another VGAM1741 host target gene. TTY9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY9 BINDING SITE, designated SEQ ID:25678, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58511] Another function of VGAM1741 is therefore inhibition of Testis-specific Transcript, Y-linked 9 (TTY9, Accession NM\_031927). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY9. LOC145216

(Accession XM\_096730) is another VGAM1741 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40505, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58512] Another function of VGAM1741 is therefore inhibition of LOC145216 (Accession XM\_096730). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC152457 (Accession XM\_087476) is another VGAM1741 host target gene. LOC152457 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152457 BINDING SITE, designated SEQ ID:39279, to the nucleotide sequence of VGAM1741 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4452.

[58513] Another function of VGAM1741 is therefore inhibition of LOC152457 (Accession XM\_087476). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152457. LOC221421 (Accession XM\_166428) is another VGAM1741 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:44323, to the nucleotide sequence of VGAM1741 RNA, herein designated VGAM RNA, also designated SEQ ID:4452.

[58514] Another function of VGAM1741 is therefore inhibition of LOC221421 (Accession XM\_166428). Accordingly, utilities of VGAM1741 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221421. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1742 (VGAM1742) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58515] VGAM1742 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1742 was detected is described hereinabove with reference to Figs. 1–8.

[58516] VGAM1742 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58517] VGAM1742 gene encodes a VGAM1742 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1742 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1742 precursor RNA is designated SEQ ID:1728, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1728 is located at position 40735 relative to the genome of Cercopithecine Herpesvirus 7.

[58518] VGAM1742 precursor RNA folds onto itself, forming

VGAM1742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58519] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1742 folded precursor RNA into VGAM1742 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1742 RNA is designated SEQ ID:4453, and is provided hereinbelow with reference to the sequence listing part.

[58520] VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1742 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58521] VGAM1742 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1742 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1742 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58522] The complementary binding of VGAM1742 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1742 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1742 host target RNA into VGAM1742 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58523] It is appreciated that VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1742 host target genes. The mRNA of each one of this plurality of VGAM1742 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1742 RNA, herein designated VGAM RNA, and which when bound by VGAM1742 RNA causes inhibition of translation of respective one or more VGAM1742 host target proteins.

[58524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1742 gene, herein designated VGAM GENE, on one or more VGAM1742 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58525] It is yet further appreciated that a function of VGAM1742 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1742 correlate with, and may be deduced from, the identity of the host target genes which VGAM1742 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58526] Nucleotide sequences of the VGAM1742 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1742 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1742 are further described hereinbelow with reference to Table 1.

[58527] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1742 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1742 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58528] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1742 gene, herein designated VGAM is inhibition of expression of VGAM1742 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1742 correlate with, and may be deduced from, the identity of the target genes which VGAM1742 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[58529] COX10 Homolog, Cytochrome C Oxidase Assembly Protein, Heme A: Farnesyltransferase (yeast) (COX10, Accession NM\_001303) is a VGAM1742 host target gene. COX10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by COX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX10 BINDING SITE, designated SEQ ID:6980, to the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, also designated SEQ ID:4453.

[58530] A function of VGAM1742 is therefore inhibition of COX10 Homolog, Cytochrome C Oxidase Assembly Protein, Heme A: Farnesyltransferase (yeast) (COX10, Accession NM\_001303). Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX10. FLJ22055 (Accession NM\_024779) is another VGAM1742 host target gene. FLJ22055 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22055, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22055 BINDING SITE, designated SEQ ID:24147, to the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, also designated SEQ ID:4453.

[58531] Another function of VGAM1742 is therefore inhibition of FLJ22055 (Accession NM\_024779). Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22055. KIAA0802 (Accession XM\_031357) is another VGAM1742 host target gene. KIAA0802 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0802 BINDING SITE, designated SEQ ID:31352, to the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, also designated SEQ ID:4453.

[58532] Another function of VGAM1742 is therefore inhibition of KIAA0802 (Accession XM\_031357). Accordingly, utilities of VGAM1742 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0802. LOC115574 (Accession XM\_056240) is another VGAM1742 host target gene. LOC115574 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115574 BINDING SITE, designated SEQ ID:36367, to the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, also designated SEQ ID:4453.

[58533] Another function of VGAM1742 is therefore inhibition of LOC115574 (Accession XM\_056240). Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115574. LOC221968 (Accession XM\_166524) is another VGAM1742 host target gene. LOC221968 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221968, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221968 BINDING SITE, designated SEQ ID:44471, to

the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, also designated SEQ ID:4453.

[58534] Another function of VGAM1742 is therefore inhibition of LOC221968 (Accession XM\_166524). Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221968. LOC256021 (Accession XM\_172884) is another VGAM1742 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:46164, to the nucleotide sequence of VGAM1742 RNA, herein designated VGAM RNA, also designated SEQ ID:4453.

[58535] Another function of VGAM1742 is therefore inhibition of LOC256021 (Accession XM\_172884). Accordingly, utilities of VGAM1742 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1743 (VGAM1743) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58536] VGAM1743 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1743 was detected is described hereinabove with reference to Figs. 1–8.

[58537] VGAM1743 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58538] VGAM1743 gene encodes a VGAM1743 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1743 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1743 precursor RNA is designated SEQ ID:1729, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1729 is located at position 41519 relative to the genome of Cercopithecine Herpesvirus 7.

[58539] VGAM1743 precursor RNA folds onto itself, forming VGAM1743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58540] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1743 folded precursor RNA into VGAM1743 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1743 RNA is designated SEQ ID:4454, and is provided hereinbelow with reference to the sequence listing part.

[58541] VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1743 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1743 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[58542] VGAM1743 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1743 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1743 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58543] The complementary binding of VGAM1743 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1743 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1743 host target RNA into VGAM1743 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58544] It is appreciated that VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1743 host target genes. The mRNA of each one of this plurality of VGAM1743 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1743 RNA, herein designated VGAM RNA, and which when bound by VGAM1743 RNA causes inhibition of translation of respective one or more VGAM1743 host target proteins.

[58545] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1743 gene, herein designated VGAM GENE, on one or more VGAM1743 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58546] It is yet further appreciated that a function of VGAM1743 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1743 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1743 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58547] Nucleotide sequences of the VGAM1743 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1743 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1743 are further described hereinbelow with reference to Table 1.

[58548] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1743 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1743 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58549] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1743 gene, herein designated VGAM is inhibition of expression of VGAM1743 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1743 correlate with, and may be deduced from, the identity of the target genes which VGAM1743

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58550] A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274) is a VGAM1743 host target gene. ADAM19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM19 BINDING SITE, designated SEQ ID:27097, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58551] A function of VGAM1743 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 19 (meltrin beta) (ADAM19, Accession NM\_033274), a gene which participates in the proteolytic processing of beta-type neuregulin isoforms . Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM19. The function of ADAM19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM179.Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM\_167853) is another VGAM1743 host target gene. NUMA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:44879, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58552] Another function of VGAM1743 is therefore inhibition of Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM\_167853), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1. The function of NUMA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM192.ATIP1 (Accession NM\_020749) is another VGAM1743 host target gene. ATIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by ATIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATIP1 BINDING SITE, designated SEQ ID:21861, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58553] Another function of VGAM1743 is therefore inhibition of ATIP1 (Accession NM\_020749). Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATIP1. KIAA0295 (Accession XM\_042833) is another VGAM1743 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33783, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58554] Another function of VGAM1743 is therefore inhibition of KIAA0295 (Accession XM\_042833). Accordingly, utilities

of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. Ring Finger Protein 24 (RNF24, Accession NM\_007219) is another VGAM1743 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14084, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58555] Another function of VGAM1743 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM\_007219). Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. VIT1 (Accession NM\_018693) is another VGAM1743 host target gene. VIT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of VIT1 BINDING SITE, designated SEQ ID:20766, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58556] Another function of VGAM1743 is therefore inhibition of VIT1 (Accession NM\_018693). Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIT1. LOC118786 (Accession XM\_061147) is another VGAM1743 host target gene. LOC118786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC118786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118786 BINDING SITE, designated SEQ ID:37197, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58557] Another function of VGAM1743 is therefore inhibition of LOC118786 (Accession XM\_061147). Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118786. LOC121441 (Accession XM\_058561) is an-

other VGAM1743 host target gene. LOC121441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121441 BINDING SITE, designated SEQ ID:36659, to the nucleotide sequence of VGAM1743 RNA, herein designated VGAM RNA, also designated SEQ ID:4454.

[58558] Another function of VGAM1743 is therefore inhibition of LOC121441 (Accession XM\_058561). Accordingly, utilities of VGAM1743 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121441. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1744 (VGAM1744) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58559] VGAM1744 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1744 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[58560] VGAM1744 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58561] VGAM1744 gene encodes a VGAM1744 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1744 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1744 precursor RNA is designated SEQ ID:1730, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1730 is located at position 38434 relative to the genome of Cercopithecine Herpesvirus 7.

[58562] VGAM1744 precursor RNA folds onto itself, forming VGAM1744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58563] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1744 folded precursor RNA into VGAM1744 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1744 RNA is designated SEQ ID:4455, and is provided hereinbelow with reference to the sequence listing part.

[58564] VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1744 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58565] VGAM1744 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1744 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1744 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1744 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58566] The complementary binding of VGAM1744 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1744 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1744 host target RNA into VGAM1744 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58567] It is appreciated that VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1744 host target genes. The mRNA of each one of this plurality of VGAM1744 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1744 RNA, herein designated VGAM RNA, and which when bound by VGAM1744 RNA causes inhibition of translation of respective one or more VGAM1744 host target proteins.

[58568] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1744 gene, herein designated VGAM GENE, on one or more VGAM1744 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58569] It is yet further appreciated that a function of VGAM1744 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1744 correlate with, and may be deduced from, the identity of the host target genes which VGAM1744 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58570] Nucleotide sequences of the VGAM1744 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1744 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1744 are further described hereinbelow with reference to Table 1.

[58571] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1744 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1744 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58572] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1744 gene, herein designated VGAM is inhibition of expression of VGAM1744 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1744 correlate with, and may be deduced from, the identity of the target genes which VGAM1744 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58573] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 5 (ABCC5, Accession NM\_005688) is a VGAM1744 host target gene. ABCC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCC5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC5 BINDING SITE, designated SEQ ID:12249, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58574] A function of VGAM1744 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 5 (ABCC5, Accession NM\_005688), a gene which acts as a multispecific organic anion pump which can transport nucleotide analogs. Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC5. The function of ABCC5 has been established by previous studies. Multidrug resistance (MDR) proteins (MRPs) mediate the extrusion of drugs from normal cells and tumors. MDR/ATP-binding cassette (ABC) membrane proteins are involved in energy-dependent transport of a wide variety of substrates. Allikmets et al. (1996) and Kool et al. (1997) used EST database searching to identify partial cDNAs encoding ABCC5 (see OMIM Ref. No. ABCC4, 605250). Using RT-PCR with degenerate primers, Suzuki et al. (1997) isolated a cDNA encoding short MRP, an apparent splice vari-

ant of ABCC5 (Suzuki et al., 2000). By EST database searching, followed by 5-prime RACE, Belinsky et al. (1998) obtained a cDNA encoding full-length ABCC5, which they termed MOATC (multispecific organic anion transporter C). Sequence analysis predicted that the 1,437-amino acid protein, like other ABC transporters, contains Walker A, B and C motifs, nucleotide-binding folds, and 12 transmembrane spanning helices in 2 hydrophobic domains. Kool et al. (1997), Suzuki et al. (1997), and Belinsky et al. (1998) performed Northern blot analysis which revealed ubiquitous expression of a 6.6-kb ABCC5 transcript with highest levels in skeletal muscle followed by brain, kidney, testis, and heart. Oguri et al. (2000) noted that the effectiveness of platinum drugs in lung cancer is limited by the development of drug resistance to them. Quantitative RT-PCR analysis showed that expression of ABCC5, like that of ABCC1 (OMIM Ref. No. 158343) and gamma-glutamylcysteine synthetase (see OMIM Ref. No. 606857), is increased in normal and tumor lung tissue from patients with previous platinum exposure. However, in vitro exposure of lung cancer cells to the platinum drug cisplatin, or of mononuclear cells to carboplatin, does not cause increased expression of

ABCC5.

[58575] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58576] Suzuki, T.; Sasaki, H.; Kuh, H.-J.; Agui, M.; Tatsumi, Y.; Tanabe, S.; Terada, M.; Saijo, N.; Nishio, K. : Detailed structural analysis on both human MRP5 and mouse mrp5 transcripts. Gene 242: 167–173, 2000. ; and

[58577] Oguri, T.; Isobe, T.; Suzuki, T.; Nishio, K.; Fujiwara, Y.; Kato, O.; Yamakido, M. : Increased expression of the MRP5 gene is associated with exposure to platinum drugs in lung cancer.

[58578] Further studies establishing the function and utilities of ABCC5 are found in John Hopkins OMIM database record ID 605251, and in cited publications numbered 282 and 5013–4401 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ21736 (Accession NM\_024922) is another VGAM1744 host target gene. FLJ21736 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ21736 BINDING SITE, designated SEQ ID:24460, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58579] Another function of VGAM1744 is therefore inhibition of FLJ21736 (Accession NM\_024922). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_139201) is another VGAM1744 host target gene. GIT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GIT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE, designated SEQ ID:29213, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58580] Another function of VGAM1744 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_139201). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with GIT2. KIAA1128 (Accession XM\_043596) is another VGAM1744 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33968, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58581] Another function of VGAM1744 is therefore inhibition of KIAA1128 (Accession XM\_043596). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. KIAA1384 (Accession XM\_035405) is another VGAM1744 host target gene. KIAA1384 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1384 BINDING SITE, designated SEQ ID:32260, to the

nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58582] Another function of VGAM1744 is therefore inhibition of KIAA1384 (Accession XM\_035405). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1384. KIAA1958 (Accession XM\_088566) is another VGAM1744 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1958 BINDING SITE, designated SEQ ID:39831, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58583] Another function of VGAM1744 is therefore inhibition of KIAA1958 (Accession XM\_088566). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. LOC143915 (Accession XM\_096502) is another VGAM1744 host target gene. LOC143915 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC143915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143915 BINDING SITE, designated SEQ ID:40378, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58584] Another function of VGAM1744 is therefore inhibition of LOC143915 (Accession XM\_096502). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143915. LOC200558 (Accession XM\_114258) is another VGAM1744 host target gene. LOC200558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200558 BINDING SITE, designated SEQ ID:42819, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58585] Another function of VGAM1744 is therefore inhibition of LOC200558 (Accession XM\_114258). Accordingly, utilities

of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200558. LOC202934 (Accession XM\_117486) is another VGAM1744 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43455, to the nucleotide sequence of VGAM1744 RNA, herein designated VGAM RNA, also designated SEQ ID:4455.

[58586] Another function of VGAM1744 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM1744 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1745 (VGAM1745) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58587] VGAM1745 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1745 was detected is described hereinabove with reference to Figs. 1–8.

[58588] VGAM1745 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58589] VGAM1745 gene encodes a VGAM1745 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1745 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1745 precursor RNA is designated SEQ ID:1731, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1731 is located at position 37836 relative to the genome of Cercopithecine Herpesvirus 7.

[58590] VGAM1745 precursor RNA folds onto itself, forming VGAM1745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58591] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1745 folded precursor RNA into VGAM1745 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1745 RNA is designated SEQ ID:4456, and is provided hereinbelow with reference to the sequence listing part.

[58592] VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1745 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[58593] VGAM1745 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1745 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1745 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58594] The complementary binding of VGAM1745 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1745 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1745 host target RNA into VGAM1745 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58595] It is appreciated that VGAM1745 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1745 host target genes. The mRNA of each one of this plurality of VGAM1745 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1745 RNA, herein designated VGAM RNA, and which when bound by VGAM1745 RNA causes inhibition of translation of respective one or more VGAM1745 host target proteins.

[58596] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1745 gene, herein designated VGAM GENE, on one or more VGAM1745 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58597] It is yet further appreciated that a function of VGAM1745 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1745 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1745 correlate with, and may be deduced from, the identity of the host target genes which VGAM1745 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58598] Nucleotide sequences of the VGAM1745 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1745 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1745 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1745 are further  
described hereinbelow with reference to Table 1.

[58599] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1745 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1745 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[58600] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1745 gene, herein designated VGAM is  
inhibition of expression of VGAM1745 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1745 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1745  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[58601] Protein Kinase C, Nu (PRKCN, Accession NM\_005813) is a  
VGAM1745 host target gene. PRKCN BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:12397, to the nucleotide sequence of VGAM1745 RNA, herein designated VGAM RNA, also designated SEQ ID:4456.

[58602] A function of VGAM1745 is therefore inhibition of Protein Kinase C,  $\alpha$  (PRKCN, Accession NM\_005813). Accordingly, utilities of VGAM1745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. KIAA1432 (Accession XM\_039698) is another VGAM1745 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33147, to the nucleotide sequence of VGAM1745 RNA, herein designated VGAM RNA, also designated SEQ ID:4456.

[58603] Another function of VGAM1745 is therefore inhibition of

KIAA1432 (Accession XM\_039698). Accordingly, utilities of VGAM1745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. MO25 (Accession NM\_016289) is another VGAM1745 host target gene. MO25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MO25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MO25 BINDING SITE, designated SEQ ID:18414, to the nucleotide sequence of VGAM1745 RNA, herein designated VGAM RNA, also designated SEQ ID:4456.

[58604] Another function of VGAM1745 is therefore inhibition of MO25 (Accession NM\_016289). Accordingly, utilities of VGAM1745 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MO25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1746 (VGAM1746) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58605] VGAM1746 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1746 was detected is described hereinabove with reference to Figs. 1–8.

[58606] VGAM1746 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58607] VGAM1746 gene encodes a VGAM1746 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1746 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1746 precursor RNA is designated SEQ ID:1732, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1732 is located at position 40845 relative to the genome of Cercopithecine Herpesvirus 7.

[58608] VGAM1746 precursor RNA folds onto itself, forming VGAM1746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58609] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1746 folded precursor RNA into VGAM1746 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1746 RNA is designated SEQ ID:4457, and is provided hereinbelow with reference to the sequence listing part.

[58610] VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1746 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[58611] VGAM1746 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1746 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1746 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58612] The complementary binding of VGAM1746 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1746 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1746 host target RNA into VGAM1746 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58613] It is appreciated that VGAM1746 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1746 host target genes. The mRNA of each one of this plurality of VGAM1746 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1746 RNA, herein designated VGAM RNA, and which when bound by VGAM1746 RNA causes inhibition of translation of respective one or more VGAM1746 host target proteins.

[58614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1746 gene, herein designated VGAM GENE, on one or more VGAM1746 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58615] It is yet further appreciated that a function of VGAM1746 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1746 correlate with, and may be deduced from, the identity of the host target genes which VGAM1746 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58616] Nucleotide sequences of the VGAM1746 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1746 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1746 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1746 are further  
described hereinbelow with reference to Table 1.

[58617] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1746 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1746 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[58618] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1746 gene, herein designated VGAM is  
inhibition of expression of VGAM1746 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1746 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1746  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[58619] SNL (Accession NM\_003088) is a VGAM1746 host target  
gene. SNL BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9062, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58620] A function of VGAM1746 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM\_003242) is another VGAM1746 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of TGFBR2 BINDING SITE, designated SEQ ID:9236, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58621] Another function of VGAM1746 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM\_003242). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR2. Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445) is another VGAM1746 host target gene. TPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPK1 BINDING SITE, designated SEQ ID:22778, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58622] Another function of VGAM1746 is therefore inhibition of Thiamin Pyrophosphokinase 1 (TPK1, Accession NM\_022445), a gene which catalyzes the conversion of thiamine, a form of vitamin B1, to thiamine pyrophos-

phate . Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPK1. The function of TPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM475.KIAA0528 (Accession XM\_051454) is another VGAM1746 host target gene. KIAA0528 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0528 BINDING SITE, designated SEQ ID:35839, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58623] Another function of VGAM1746 is therefore inhibition of KIAA0528 (Accession XM\_051454). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0528. KIAA1128 (Accession XM\_043596) is another VGAM1746 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33963, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58624] Another function of VGAM1746 is therefore inhibition of KIAA1128 (Accession XM\_043596). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. Zinc Finger Protein 387 (ZNF387, Accession NM\_014682) is another VGAM1746 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16176, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58625] Another function of VGAM1746 is therefore inhibition of

Zinc Finger Protein 387 (ZNF387, Accession NM\_014682). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC197317 (Accession XM\_117014) is another VGAM1746 host target gene. LOC197317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197317 BINDING SITE, designated SEQ ID:43205, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58626] Another function of VGAM1746 is therefore inhibition of LOC197317 (Accession XM\_117014). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197317. LOC199926 (Accession XM\_117157) is another VGAM1746 host target gene. LOC199926 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199926, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199926 BINDING SITE, designated SEQ ID:43259, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58627] Another function of VGAM1746 is therefore inhibition of LOC199926 (Accession XM\_117157). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199926. LOC202025 (Accession XM\_117353) is another VGAM1746 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43403, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58628] Another function of VGAM1746 is therefore inhibition of LOC202025 (Accession XM\_117353). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC202025. LOC202316 (Accession XM\_117380) is another VGAM1746 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43423, to the nucleotide sequence of VGAM1746 RNA, herein designated VGAM RNA, also designated SEQ ID:4457.

[58629] Another function of VGAM1746 is therefore inhibition of LOC202316 (Accession XM\_117380). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. LOC90494 (Accession XM\_032161) is another VGAM1746 host target gene. LOC90494 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90494 BINDING SITE, designated SEQ ID:31577, to the nucleotide sequence of VGAM1746 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4457.

[58630] Another function of VGAM1746 is therefore inhibition of LOC90494 (Accession XM\_032161). Accordingly, utilities of VGAM1746 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90494. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1747 (VGAM1747) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58631] VGAM1747 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1747 was detected is described hereinabove with reference to Figs. 1–8.

[58632] VGAM1747 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58633] VGAM1747 gene encodes a VGAM1747 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1747 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1747 precursor RNA is designated SEQ ID:1733, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1733 is located at position 11942 relative to the genome of Camelpox Virus.

[58634] VGAM1747 precursor RNA folds onto itself, forming VGAM1747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58635] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1747 folded precursor RNA into VGAM1747 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1747 RNA is designated SEQ ID:4458, and is provided hereinbelow with reference to the sequence listing part.

[58636] VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1747 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58637] VGAM1747 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1747 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1747 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[58638] The complementary binding of VGAM1747 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1747 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1747 host target RNA into VGAM1747 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58639] It is appreciated that VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1747 host target genes. The mRNA of

each one of this plurality of VGAM1747 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1747 RNA, herein designated VGAM RNA, and which when bound by VGAM1747 RNA causes inhibition of translation of respective one or more VGAM1747 host target proteins.

[58640] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1747 gene, herein designated VGAM GENE, on one or more VGAM1747 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[58641] It is yet further appreciated that a function of VGAM1747 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1747 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1747 correlate with, and may be deduced from, the identity of the host target genes which VGAM1747 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58642] Nucleotide sequences of the VGAM1747 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1747 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1747 are further described hereinbelow with reference to Table 1.

[58643] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1747 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1747 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58644] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1747 gene, herein designated VGAM is inhibition of expression of VGAM1747 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1747 correlate with, and may be deduced from, the identity of the target genes which VGAM1747 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58645] MGC4342 (Accession NM\_024329) is a VGAM1747 host target gene. MGC4342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4342 BINDING SITE, designated SEQ ID:23623, to the nucleotide sequence of VGAM1747 RNA, herein designated VGAM RNA, also designated SEQ ID:4458.

[58646] A function of VGAM1747 is therefore inhibition of MGC4342 (Accession NM\_024329). Accordingly, utilities of VGAM1747 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC4342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1748 (VGAM1748) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58647] VGAM1748 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1748 was detected is described hereinabove with reference to Figs. 1–8.

[58648] VGAM1748 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58649] VGAM1748 gene encodes a VGAM1748 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1748 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1748 precursor RNA is desig-

nated SEQ ID:1734, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1734 is located at position 67 relative to the genome of Camelpox Virus.

- [58650] VGAM1748 precursor RNA folds onto itself, forming VGAM1748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58651] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1748 folded precursor RNA into VGAM1748 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1748 RNA is designated SEQ ID:4459, and is provided hereinbelow with reference to the sequence

listing part.

[58652] VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1748 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58653] VGAM1748 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1748 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1748 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58654] The complementary binding of VGAM1748 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1748 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1748 host target RNA into VGAM1748 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58655] It is appreciated that VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1748 host target genes. The mRNA of each one of this plurality of VGAM1748 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1748 RNA, herein designated VGAM

RNA, and which when bound by VGAM1748 RNA causes inhibition of translation of respective one or more VGAM1748 host target proteins.

[58656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1748 gene, herein designated VGAM GENE, on one or more VGAM1748 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58657] It is yet further appreciated that a function of VGAM1748 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1748 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1748 correlate with, and may be deduced from, the identity of the host target genes which VGAM1748 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58658] Nucleotide sequences of the VGAM1748 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1748 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1748 are further described hereinbelow with reference to Table 1.

[58659] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1748 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1748 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58660] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1748 gene, herein designated VGAM is

inhibition of expression of VGAM1748 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1748 correlate with, and may be deduced from, the identity of the target genes which VGAM1748 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58661] FLJ11210 (Accession XM\_005298) is a VGAM1748 host target gene. FLJ11210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11210 BINDING SITE, designated SEQ ID:29971, to the nucleotide sequence of VGAM1748 RNA, herein designated VGAM RNA, also designated SEQ ID:4459.

[58662] A function of VGAM1748 is therefore inhibition of FLJ11210 (Accession XM\_005298). Accordingly, utilities of VGAM1748 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11210. HTCD37 (Accession XM\_041884) is another VGAM1748 host target gene. HTCD37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by HTCD37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:33618, to the nucleotide sequence of VGAM1748 RNA, herein designated VGAM RNA, also designated SEQ ID:4459.

[58663] Another function of VGAM1748 is therefore inhibition of HTCD37 (Accession XM\_041884). Accordingly, utilities of VGAM1748 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTCD37. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1749 (VGAM1749) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58664] VGAM1749 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1749 was detected is described hereinabove with reference to Figs. 1-8.

[58665] VGAM1749 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox Virus.

VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58666] VGAM1749 gene encodes a VGAM1749 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1749 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1749 precursor RNA is designated SEQ ID:1735, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1735 is located at position 4361 relative to the genome of Camelpox Virus.

[58667] VGAM1749 precursor RNA folds onto itself, forming VGAM1749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58668] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1749 folded precursor RNA into VGAM1749 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1749 RNA is designated SEQ ID:4460, and is provided hereinbelow with reference to the sequence listing part.

[58669] VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1749 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58670] VGAM1749 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1749 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1749 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58671] The complementary binding of VGAM1749 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1749 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1749

host target RNA into VGAM1749 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58672] It is appreciated that VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1749 host target genes. The mRNA of each one of this plurality of VGAM1749 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1749 RNA, herein designated VGAM RNA, and which when bound by VGAM1749 RNA causes inhibition of translation of respective one or more VGAM1749 host target proteins.

[58673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1749 gene, herein designated VGAM GENE, on one or more VGAM1749 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58674] It is yet further appreciated that a function of VGAM1749 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1749 correlate with, and may be deduced from, the identity of the host target genes which VGAM1749 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58675] Nucleotide sequences of the VGAM1749 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1749 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1749 are further

described hereinbelow with reference to Table 1.

[58676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1749 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1749 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58677] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1749 gene, herein designated VGAM is inhibition of expression of VGAM1749 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1749 correlate with, and may be deduced from, the identity of the target genes which VGAM1749 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58678] FLJ13614 (Accession NM\_139076) is a VGAM1749 host target gene. FLJ13614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13614 BINDING SITE,

designated SEQ ID:29148, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58679] A function of VGAM1749 is therefore inhibition of FLJ13614 (Accession NM\_139076). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13614. FLJ20508 (Accession NM\_017850) is another VGAM1749 host target gene. FLJ20508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:19517, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58680] Another function of VGAM1749 is therefore inhibition of FLJ20508 (Accession NM\_017850). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. KIAA1189 (Accession XM\_050508) is another VGAM1749 host target gene. KIAA1189 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1189 BINDING SITE, designated SEQ ID:35650, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58681] Another function of VGAM1749 is therefore inhibition of KIAA1189 (Accession XM\_050508). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1189. MGC10955 (Accession NM\_032676) is another VGAM1749 host target gene. MGC10955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10955 BINDING SITE, designated SEQ ID:26397, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58682] Another function of VGAM1749 is therefore inhibition of

MGC10955 (Accession NM\_032676). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10955. PRO1163 (Accession NM\_018576) is another VGAM1749 host target gene. PRO1163 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1163 BINDING SITE, designated SEQ ID:20653, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58683] Another function of VGAM1749 is therefore inhibition of PRO1163 (Accession NM\_018576). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1163. LOC118706 (Accession XM\_058336) is another VGAM1749 host target gene. LOC118706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC118706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC118706 BINDING SITE, designated SEQ ID:36596, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58684] Another function of VGAM1749 is therefore inhibition of LOC118706 (Accession XM\_058336). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118706. LOC143158 (Accession XM\_084445) is another VGAM1749 host target gene. LOC143158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143158 BINDING SITE, designated SEQ ID:37591, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58685] Another function of VGAM1749 is therefore inhibition of LOC143158 (Accession XM\_084445). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143158. LOC150862 (Accession XM\_087029) is an-

other VGAM1749 host target gene. LOC150862 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150862 BINDING SITE, designated SEQ ID:39016, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58686] Another function of VGAM1749 is therefore inhibition of LOC150862 (Accession XM\_087029). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150862. LOC151826 (Accession XM\_087312) is another VGAM1749 host target gene. LOC151826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151826 BINDING SITE, designated SEQ ID:39167, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58687] Another function of VGAM1749 is therefore inhibition of LOC151826 (Accession XM\_087312). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151826. LOC158267 (Accession XM\_088528) is another VGAM1749 host target gene. LOC158267 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158267 BINDING SITE, designated SEQ ID:39793, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58688] Another function of VGAM1749 is therefore inhibition of LOC158267 (Accession XM\_088528). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158267. LOC220466 (Accession XM\_058363) is another VGAM1749 host target gene. LOC220466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220466, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220466 BINDING SITE, designated SEQ ID:36610, to the nucleotide sequence of VGAM1749 RNA, herein designated VGAM RNA, also designated SEQ ID:4460.

[58689] Another function of VGAM1749 is therefore inhibition of LOC220466 (Accession XM\_058363). Accordingly, utilities of VGAM1749 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1750 (VGAM1750) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58690] VGAM1750 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1750 was detected is described hereinabove with reference to Figs. 1-8.

[58691] VGAM1750 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1750 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[58692] VGAM1750 gene encodes a VGAM1750 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1750 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1750 precursor RNA is designated SEQ ID:1736, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1736 is located at position 1194 relative to the genome of Camelpox Virus.

[58693] VGAM1750 precursor RNA folds onto itself, forming VGAM1750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58694] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1750 folded precursor RNA into VGAM1750

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1750 RNA is designated SEQ ID:4461, and is provided hereinbelow with reference to the sequence listing part.

[58695] VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1750 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58696] VGAM1750 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1750 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1750 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58697] The complementary binding of VGAM1750 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1750 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1750 host target RNA into VGAM1750 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[58698] It is appreciated that VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1750 host target genes. The mRNA of each one of this plurality of VGAM1750 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1750 RNA, herein designated VGAM RNA, and which when bound by VGAM1750 RNA causes inhibition of translation of respective one or more VGAM1750 host target proteins.

[58699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1750 gene, herein designated VGAM GENE, on one or more VGAM1750 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58700] It is yet further appreciated that a function of VGAM1750 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1750 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1750 correlate with, and may be deduced from, the identity of the host target genes which VGAM1750 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58701] Nucleotide sequences of the VGAM1750 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1750 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1750 are further described hereinbelow with reference to Table 1.

[58702] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1750 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1750 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58703] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1750 gene, herein designated VGAM is inhibition of expression of VGAM1750 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1750 correlate with, and may be deduced from, the identity of the target genes which VGAM1750 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58704] LOC152078 (Accession XM\_087376) is a VGAM1750 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39213, to the nucleotide sequence of VGAM1750 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4461.

[58705] A function of VGAM1750 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities of VGAM1750 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1751 (VGAM1751) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58706] VGAM1751 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1751 was detected is described hereinabove with reference to Figs. 1–8.

[58707] VGAM1751 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58708] VGAM1751 gene encodes a VGAM1751 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1751 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1751 precursor RNA is designated SEQ ID:1737, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1737 is located at position 58 relative to the genome of Camelpox Virus.

- [58709] VGAM1751 precursor RNA folds onto itself, forming VGAM1751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58710] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1751 folded precursor RNA into VGAM1751 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1751 RNA is designated SEQ ID:4462, and is provided hereinbelow with reference to the sequence listing part.

[58711] VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1751 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58712] VGAM1751 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1751 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1751 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58713] The complementary binding of VGAM1751 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1751 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1751 host target RNA into VGAM1751 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58714] It is appreciated that VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1751 host target genes. The mRNA of

each one of this plurality of VGAM1751 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1751 RNA, herein designated VGAM RNA, and which when bound by VGAM1751 RNA causes inhibition of translation of respective one or more VGAM1751 host target proteins.

[58715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1751 gene, herein designated VGAM GENE, on one or more VGAM1751 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[58716] It is yet further appreciated that a function of VGAM1751 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1751 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1751 correlate with, and may be deduced from, the identity of the host target genes which VGAM1751 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58717] Nucleotide sequences of the VGAM1751 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1751 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1751 are further described hereinbelow with reference to Table 1.

[58718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1751 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1751 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58719] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1751 gene, herein designated VGAM is inhibition of expression of VGAM1751 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1751 correlate with, and may be deduced from, the identity of the target genes which VGAM1751 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58720] LOC152078 (Accession XM\_087376) is a VGAM1751 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39213, to the nucleotide sequence of VGAM1751 RNA, herein designated VGAM RNA, also designated SEQ ID:4462.

[58721] A function of VGAM1751 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities of VGAM1751 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1752 (VGAM1752) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58722] VGAM1752 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1752 was detected is described hereinabove with reference to Figs. 1–8.

[58723] VGAM1752 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58724] VGAM1752 gene encodes a VGAM1752 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1752 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1752 precursor RNA is desig-

nated SEQ ID:1738, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1738 is located at position 2927 relative to the genome of Camelpox Virus.

- [58725] VGAM1752 precursor RNA folds onto itself, forming VGAM1752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58726] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1752 folded precursor RNA into VGAM1752 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1752 RNA is designated SEQ ID:4463, and is provided hereinbelow with reference to the sequence

listing part.

[58727] VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1752 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58728] VGAM1752 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1752 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1752 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58729] The complementary binding of VGAM1752 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1752 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1752 host target RNA into VGAM1752 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58730] It is appreciated that VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1752 host target genes. The mRNA of each one of this plurality of VGAM1752 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1752 RNA, herein designated VGAM

RNA, and which when bound by VGAM1752 RNA causes inhibition of translation of respective one or more VGAM1752 host target proteins.

[58731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1752 gene, herein designated VGAM GENE, on one or more VGAM1752 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58732] It is yet further appreciated that a function of VGAM1752 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1752 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1752 correlate with, and may be deduced from, the identity of the host target genes which VGAM1752 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58733] Nucleotide sequences of the VGAM1752 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1752 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1752 are further described hereinbelow with reference to Table 1.

[58734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1752 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1752 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58735] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1752 gene, herein designated VGAM is

inhibition of expression of VGAM1752 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1752 correlate with, and may be deduced from, the identity of the target genes which VGAM1752 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58736] Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM\_018312) is a VGAM1752 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20298, to the nucleotide sequence of VGAM1752 RNA, herein designated VGAM RNA, also designated SEQ ID:4463.

[58737] A function of VGAM1752 is therefore inhibition of Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM\_018312). Accordingly, utilities of VGAM1752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23. LOC160646 (Accession XM\_090413) is another VGAM1752 host target

gene. LOC160646 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC160646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160646 BINDING SITE, designated SEQ ID:40000, to the nucleotide sequence of VGAM1752 RNA, herein designated VGAM RNA, also designated SEQ ID:4463.

[58738] Another function of VGAM1752 is therefore inhibition of LOC160646 (Accession XM\_090413). Accordingly, utilities of VGAM1752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160646. LOC201475 (Accession XM\_113967) is another VGAM1752 host target gene. LOC201475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201475 BINDING SITE, designated SEQ ID:42576, to the nucleotide sequence of VGAM1752 RNA, herein designated VGAM RNA, also designated SEQ ID:4463.

[58739] Another function of VGAM1752 is therefore inhibition of LOC201475 (Accession XM\_113967). Accordingly, utilities of VGAM1752 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201475. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1753 (VGAM1753) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58740] VGAM1753 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1753 was detected is described hereinabove with reference to Figs. 1–8.

[58741] VGAM1753 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58742] VGAM1753 gene encodes a VGAM1753 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1753 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1753 precursor RNA is designated SEQ ID:1739, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1739 is located at position 2271 relative to the genome of Camelpox Virus.

[58743] VGAM1753 precursor RNA folds onto itself, forming VGAM1753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58744] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1753 folded precursor RNA into VGAM1753 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1753 RNA is designated SEQ ID:4464, and is provided hereinbelow with reference to the sequence listing part.

[58745] VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1753 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[58746] VGAM1753 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1753 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1753 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58747] The complementary binding of VGAM1753 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1753 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1753 host target RNA into VGAM1753 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58748] It is appreciated that VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1753 host target genes. The mRNA of each one of this plurality of VGAM1753 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1753 RNA, herein designated VGAM RNA, and which when bound by VGAM1753 RNA causes inhibition of translation of respective one or more VGAM1753 host target proteins.

[58749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1753 gene, herein designated VGAM GENE, on one or more VGAM1753 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58750] It is yet further appreciated that a function of VGAM1753 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1753 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1753 correlate with, and may be deduced from, the identity of the host target genes which VGAM1753 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58751] Nucleotide sequences of the VGAM1753 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1753 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1753 are further described hereinbelow with reference to Table 1.

[58752] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1753 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1753 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[58753] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1753 gene, herein designated VGAM is inhibition of expression of VGAM1753 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1753 correlate with, and may be deduced from, the identity of the target genes which VGAM1753 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58754] EFG1 (Accession XM\_170611) is a VGAM1753 host target gene. EFG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFG1 BINDING SITE, designated SEQ ID:45397, to the nucleotide sequence of VGAM1753 RNA, herein designated VGAM RNA, also designated SEQ ID:4464.

[58755] A function of VGAM1753 is therefore inhibition of EFG1 (Accession XM\_170611), a gene which promotes the gtp-dependent translocation of the nascent protein chain from the a-site to the p-site of the ribosome in the mitochondria. Accordingly, utilities of VGAM1753 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with EFG1. The function of EFG1 has been established by previous studies. By EST database searching with rat Efg as probe, followed by PCR of a testis cDNA library, Gao et al. (2001) obtained cDNAs encoding mouse and human EFG1, which they called GFM. EFG1 encodes a deduced 751-amino acid protein that shares 84% and 89% sequence identity with rat Efg and mouse Gfm, respectively, and contains a conserved GTP-binding elongation factor signature and a GTP-binding domain composed of 3 motifs. Northern blot analysis revealed wide expression of 3.8- and 3.4-kb transcripts, abundant in heart, skeletal muscle, and testis, as well as testis-specific expression of a 2.9-kb transcript. Independently, Hammarsund et al. (2001) identified and characterized mitochondrial elongation factor-2 (EFG2; 606544) and used information contained in public databases to identify and clone the complete coding sequence of the human EFG1 gene on chromosome 3q25.

[58756] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58757] Gao, J.; Yu, L.; Zhang, P.; Jiang, J.; Chen, J.; Peng, J.; Wei,

Y.; Zhao, S. : Cloning and characterization of human and mouse mitochondrial elongation factor G, GFM and Gfm, and mapping of GFM to human chromosome

3q25.1–q26.2. Genomics 74: 109–114, 2001. ; and

[58758] Hammarsund, M.; Wilson, W.; Corcoran, M.; Merup, M.; Einhorn, S.; Grander, D.; Sangfelt, O. : Identification and characterization of two novel human mitochondrial elongation factor gene.

[58759] Further studies establishing the function and utilities of EFG1 are found in John Hopkins OMIM database record ID 606639, and in cited publications numbered 6124 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM\_001044) is another VGAM1753 host target gene. SLC6A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A3 BINDING SITE, designated SEQ ID:6713, to the nucleotide sequence of VGAM1753 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4464.

[58760] Another function of VGAM1753 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, dopamine), Member 3 (SLC6A3, Accession NM\_001044), a gene which terminates the action of dopamine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM1753 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A3. The function of SLC6A3 has been established by previous studies. Giros et al. (1996) found that the disruption of the mouse dopamine transporter gene results in spontaneous hyperlocomotion despite major adaptive changes such as decreases in neurotransmitter and receptor levels. In homozygous mice, dopamine persisted at least 100 times longer in the extracellular space, providing a biochemical explanation of the hyperdopaminergic phenotype and demonstrating the critical role of the transporter in regulating neurotransmission. The authors noted that the dopamine transporter is an obligatory target of cocaine and amphetamine, as demonstrated by the fact that these psychostimulants had no effect on locomotor activity or dopamine release and uptake in mice lacking the trans-

porter. Giros et al. (1996) stated that the DAT knockout mice should be an excellent tool for the study and development of drugs used in the management of dopaminergic dysfunction. There are similarities between the hyperdopaminergic phenotype of the knockout mice and some of the positive symptoms of schizophrenic patients. Specific blockade of the dopamine transporter with high-affinity inhibitors may be beneficial in illnesses such as Parkinson disease, where the effective levels of dopamine are markedly reduced.

[58761] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58762] Gainetdinov, R. R.; Wetsel, W. C.; Jones, S. R.; Levin, E. D.; Jaber, M.; Caron, M. G. : Role of serotonin in the paradoxical calming effect of psychostimulants on hyperactivity. Science 283: 397–401, 1999. ; and

[58763] Giros, B.; Jaber, M.; Jones, S. R.; Wightman, R. M.; Caron, M. G. : Hyperlocomotion and indifference to cocaine and amphetamine in mice lacking the dopamine receptor. Nature 370: 606–612, 1.

[58764] Further studies establishing the function and utilities of SLC6A3 are found in John Hopkins OMIM database record

ID 126455, and in cited publications numbered 2038–2046, 89 and 2293–2299 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. H2AV (Accession NM\_138635) is another VGAM1753 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:28912, to the nucleotide sequence of VGAM1753 RNA, herein designated VGAM RNA, also designated SEQ ID:4464.

[58765] Another function of VGAM1753 is therefore inhibition of H2AV (Accession NM\_138635). Accordingly, utilities of VGAM1753 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. HMP19 (Accession XM\_113455) is another VGAM1753 host target gene. HMP19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HMP19 BINDING SITE, designated SEQ ID:42273, to the nucleotide sequence of VGAM1753 RNA, herein designated VGAM RNA, also designated SEQ ID:4464.

[58766] Another function of VGAM1753 is therefore inhibition of HMP19 (Accession XM\_113455). Accordingly, utilities of VGAM1753 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMP19. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1754 (VGAM1754) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58767] VGAM1754 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1754 was detected is described hereinabove with reference to Figs. 1–8.

[58768] VGAM1754 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58769] VGAM1754 gene encodes a VGAM1754 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1754 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1754 precursor RNA is designated SEQ ID:1740, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1740 is located at position 9493 relative to the genome of Camelpox Virus.

[58770] VGAM1754 precursor RNA folds onto itself, forming VGAM1754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58771] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1754 folded precursor RNA into VGAM1754 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1754 RNA is designated SEQ ID:4465, and is provided hereinbelow with reference to the sequence listing part.

[58772] VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1754 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58773] VGAM1754 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1754 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1754 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58774] The complementary binding of VGAM1754 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1754 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1754 host target RNA into VGAM1754 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58775] It is appreciated that VGAM1754 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1754 host target genes. The mRNA of each one of this plurality of VGAM1754 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1754 RNA, herein designated VGAM RNA, and which when bound by VGAM1754 RNA causes inhibition of translation of respective one or more VGAM1754 host target proteins.

[58776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1754 gene, herein designated VGAM GENE, on one or more VGAM1754 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[58777] It is yet further appreciated that a function of VGAM1754 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1754 correlate with, and may be deduced from, the identity of the host target genes which VGAM1754 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58778] Nucleotide sequences of the VGAM1754 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1754 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1754 are further described hereinbelow with reference to Table 1.

[58779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1754 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1754 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58780] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1754 gene, herein designated VGAM is inhibition of expression of VGAM1754 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1754 correlate with, and may be deduced from, the identity of the target genes which VGAM1754 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58781] Caveolin 1, Caveolae Protein, 22kDa (CAV1, Accession NM\_001753) is a VGAM1754 host target gene. CAV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAV1 BINDING SITE, designated SEQ ID:7489, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58782] A function of VGAM1754 is therefore inhibition of Cave-

olin 1, Caveolae Protein, 22kDa (CAV1, Accession NM\_001753), a gene which may act as a scaffolding protein within caveolar membranes, and interacts directly with g-protein alpha subunits and can functionally regulate their activity. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAV1. The function of CAV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331. Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092) is another VGAM1754 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14384, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58783] Another function of VGAM1754 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092), a gene which forms homodimers and func-

tions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Integrin, Alpha 11 (ITGA11, Accession NM\_012211) is another VGAM1754 host target gene. ITGA11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA11 BINDING SITE, designated SEQ ID:14513, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58784] Another function of VGAM1754 is therefore inhibition of Integrin, Alpha 11 (ITGA11, Accession NM\_012211), a gene which acts as a collagen I receptor. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA11. The function of ITGA11 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM\_005587) is another VGAM1754 host target gene. MEF2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE, designated SEQ ID:12116, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58785] Another function of VGAM1754 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM\_005587), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2A. The function of MEF2A and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM46. Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM\_000381) is another VGAM1754 host target gene. MID1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MID1 BINDING SITE, designated SEQ ID:5955, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58786] Another function of VGAM1754 is therefore inhibition of Midline 1 (Opitz/BBB syndrome) (MID1, Accession NM\_000381). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MID1. Mucin 3B (MUC3B, Accession XM\_168578) is another VGAM1754 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ

ID:45257, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58787] Another function of VGAM1754 is therefore inhibition of Mucin 3B (MUC3B, Accession XM\_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656) is another VGAM1754 host target gene. NEU3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEU3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:13457, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58788] Another function of VGAM1754 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3. Plastin 3 (T isoform) (PLS3, Accession NM\_005032) is another VGAM1754 host target gene. PLS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLS3 BINDING SITE, designated SEQ ID:11473, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58789] Another function of VGAM1754 is therefore inhibition of Plastin 3 (T isoform)(PLS3, Accession NM\_005032), a gene which binds actin. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLS3. The function of PLS3 has been established by previous studies. Plastins are a family of actin-binding proteins that are differentially expressed in normal and malignant cells. Lin et al.

(1988) isolated partial cDNAs encoding T-plastin and L-plastin (OMIM Ref. No. 153430) from a transformed human fibroblast cDNA library. The C-terminal 570 amino acids of the T-plastin and L-plastin proteins are 83% identical. By 2-dimensional gel electrophoresis of human cell extracts, Lin et al. (1988) showed that T-plastin is expressed as 2 equally abundant isoforms. Northern blot analysis revealed that T-plastin is expressed as a 3.4-kb mRNA in normal cells of solid tissues and in transformed fibroblasts. Using anchored PCR, Lin et al. (1990) identified the 5-prime end of the T-plastin mRNA. The T-plastin transcript has 2 possible translation initiation codons which would result in predicted 627- and 630-amino acid proteins. The authors constructed 2 modified T-plastin cDNAs containing either the first or the second initiation codon. Expression of these cDNAs in *E. coli* resulted in the synthesis of 2 distinct T-plastins with the same isoelectric points and apparent molecular weights as the 2 T-plastins present in human cells. Lin et al. (1990) found that T-plastin contains a potential calcium-binding site near the N terminus. Lin et al. (1993) reported that both the L-plastin and T-plastin genes contain 16 exons and span approximately 90 kb

[58790] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58791] Lin, C.-S.; Aebersold, R. H.; Leavitt, J. : Correction of the N-terminal sequences of the human plastin isoforms by using anchored polymerase chain reaction: identification of a potential calcium-binding domain. *Molec. Cell. Biol.* 10: 1818-1821, 1990. ; and

[58792] Lin, C.-S.; Park, T.; Chen, Z. P.; Leavitt, J. : Human plastin genes: comparative gene structure, chromosome location, and differential expression in normal and neoplastic cells. *J. Biol.*

[58793] Further studies establishing the function and utilities of PLS3 are found in John Hopkins OMIM database record ID 300131, and in cited publications numbered 65 and 10989 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SPS2 (Accession NM\_012248) is another VGAM1754 host target gene. SPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of SPS2 BINDING SITE, designated SEQ ID:14555, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58794] Another function of VGAM1754 is therefore inhibition of SPS2 (Accession NM\_012248), a gene which synthesizes selenophosphate from selenide and ATP. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPS2. The function of SPS2 has been established by previous studies. By screening activated CD8 (see OMIM Ref. No. 186910)–positive T cells with mouse Sps2, a homolog of *E. coli* selD, as the probe, Guimaraes et al. (1996) isolated a cDNA encoding human SPS2. The deduced 448–amino acid SPS2 protein contains Walker A– and B–like motifs, which are characteristic of alpha/beta nucleotide–binding folds. The SPS2 Walker A–like motif is a gly–rich site that includes the sec residue. Northern blot analysis revealed preferential expression of a 2.3–kb transcript in mouse tissues that produce selenoproteins, with lower expression in sites of blood cell development. Levels of Sps2 mRNA were upregulated upon activation of CD4 (OMIM Ref. No. 186940)–positive lymphocytes. Western blot analysis showed that Sps2 levels were 20–fold

higher when the 3-prime untranslated region (UTR) of Sps2 was included in the expression construct in transfected cells. Southern blot analysis indicated that SPS2 is well-conserved in mammals

[58795] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58796] Guimaraes, M. J.; Peterson, D.; Vicari, A.; Cocks, B. G.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Ferrick, D. A.; Kastelein, R. A.; Bazan, J. F.; Zlotnik, A. : Identification of a novel selD homolog from eukaryotes, bacteria, and archaea: is there an autoregulatory mechanism in selenocysteine metabolism? Proc. Nat. Acad. Sci. 93: 15086-15091, 1996. ; and

[58797] Lescure, A.; Gautheret, D.; Carbon, P.; Krol, A. : Novel selenoproteins identified in silico and in vivo by using a conserved RNA structural motif. J. Biol. Chem. 274: 38147-38154, 1999.

[58798] Further studies establishing the function and utilities of SPS2 are found in John Hopkins OMIM database record ID 606218, and in cited publications numbered 6590 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TRAP240 (Accession

NM\_005121) is another VGAM1754 host target gene. TRAP240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAP240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAP240 BINDING SITE, designated SEQ ID:11604, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58799] Another function of VGAM1754 is therefore inhibition of TRAP240 (Accession NM\_005121), a gene which Subunit of TRAP thyroid hormone receptor-associated protein complex; coactivator for nuclear receptors. Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAP240. The function of TRAP240 has been established by previous studies. For background information on thyroid hormone receptor-associated proteins (TRAPs), see 300182. Using a HeLa cell line, Ito et al. (1999) cloned TRAP240, the gene encoding the 240-kD subunit of the TRAP complex. The TRAP240 cDNA encodes a 2,174-amino acid protein that shows a regional identity of

29% and a similarity of 46% with a hypothetical *C. elegans* protein (CEK08F8 and CEF07H5). It shows no obvious relationship with known consensus sequences, other than 2 ligand-dependent nuclear hormone receptor signature recognition motifs (LXXLL sequences) at positions 1188–1192 and 1279–1283, and a short leucine zipper at position 1331–1352. Northern blot analysis of multiple human tissues showed that the TRAP240 gene is ubiquitously expressed as an approximately 11.5-kb transcript. Nagase et al. (1998) also cloned the cDNA encoding TRAP240, which they referred to as KIAA0593, from a human brain cDNA library. By analysis of a human-rodent hybrid panel, Nagase et al. (1998) mapped the TRAP240 gene to chromosome 17

[58800] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58801] Ito, M.; Yuan, C.-X.; Malik, S.; Gu, W.; Fondell, J. D.; Yamamura, S.; Fu, Z.-Y.; Zhang, X.; Qin, J.; Roeder, R. G. : Identity between TRAP and SMCC complexes indicates novel pathways for the function of nuclear receptors and diverse mammalian activators. *Molec. Cell* 3: 361–370, 1999. ; and

[58802] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 100.

[58803] Further studies establishing the function and utilities of TRAP240 are found in John Hopkins OMIM database record ID 603808, and in cited publications numbered 11384 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM1754 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18365, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58804] Another function of VGAM1754 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM1754 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. CAP (Accession NM\_006367) is another VGAM1754 host target gene. CAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP BINDING SITE, designated SEQ ID:13056, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58805] Another function of VGAM1754 is therefore inhibition of CAP (Accession NM\_006367). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP. CGI-01 (Accession NM\_015935) is another VGAM1754 host target gene. CGI-01 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CGI-01, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-01 BINDING SITE, designated SEQ ID:18054, to the nucleotide sequence of

VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58806] Another function of VGAM1754 is therefore inhibition of CGI-01 (Accession NM\_015935). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-01. DKFZP434D1335 (Accession XM\_036578) is another VGAM1754 host target gene. DKFZP434D1335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434D1335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D1335 BINDING SITE, designated SEQ ID:32467, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58807] Another function of VGAM1754 is therefore inhibition of DKFZP434D1335 (Accession XM\_036578). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D1335. FLJ10498 (Accession NM\_018115) is another VGAM1754 host target gene. FLJ10498 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10498, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10498 BINDING SITE, designated SEQ ID:19887, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58808] Another function of VGAM1754 is therefore inhibition of FLJ10498 (Accession NM\_018115). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10498. FLJ10901 (Accession NM\_018265) is another VGAM1754 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20231, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58809] Another function of VGAM1754 is therefore inhibition of

FLJ10901 (Accession NM\_018265). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10901. FLJ14547 (Accession NM\_032804) is another VGAM1754 host target gene. FLJ14547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14547 BINDING SITE, designated SEQ ID:26561, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58810] Another function of VGAM1754 is therefore inhibition of FLJ14547 (Accession NM\_032804). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14547. FLJ22693 (Accession NM\_022750) is another VGAM1754 host target gene. FLJ22693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ22693 BINDING SITE, designated SEQ ID:22973, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58811] Another function of VGAM1754 is therefore inhibition of FLJ22693 (Accession NM\_022750). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22693. HBP1 (Accession NM\_012257) is another VGAM1754 host target gene. HBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBP1 BINDING SITE, designated SEQ ID:14562, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58812] Another function of VGAM1754 is therefore inhibition of HBP1 (Accession NM\_012257). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBP1. HCA3 (Accession NM\_138703) is another VGAM1754 host

target gene. HCA3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA3 BINDING SITE, designated SEQ ID:28952, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58813] Another function of VGAM1754 is therefore inhibition of HCA3 (Accession NM\_138703). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA3. HCNGP (Accession NM\_013260) is another VGAM1754 host target gene. HCNGP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCNGP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCNGP BINDING SITE, designated SEQ ID:14930, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58814] Another function of VGAM1754 is therefore inhibition of HCNGP (Accession NM\_013260). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCNGP. MGC15429 (Accession NM\_032750) is another VGAM1754 host target gene. MGC15429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15429 BINDING SITE, designated SEQ ID:26485, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58815] Another function of VGAM1754 is therefore inhibition of MGC15429 (Accession NM\_032750). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15429. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM1754 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30138, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58816] Another function of VGAM1754 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. P5-1 (Accession NM\_006674) is another VGAM1754 host target gene. P5-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:13493, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58817] Another function of VGAM1754 is therefore inhibition of P5-1 (Accession NM\_006674). Accordingly, utilities of

VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. Parvin, Alpha (PARVA, Accession NM\_018222) is another VGAM1754 host target gene. PARVA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PARVA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARVA BINDING SITE, designated SEQ ID:20144, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58818] Another function of VGAM1754 is therefore inhibition of Parvin, Alpha (PARVA, Accession NM\_018222). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARVA. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840) is another VGAM1754 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30768, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58819] Another function of VGAM1754 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. PRO0245 (Accession NM\_014122) is another VGAM1754 host target gene. PRO0245 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0245 BINDING SITE, designated SEQ ID:15377, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58820] Another function of VGAM1754 is therefore inhibition of PRO0245 (Accession NM\_014122). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PRO0245. LOC139174 (Accession XM\_066525) is another VGAM1754 host target gene. LOC139174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139174 BINDING SITE, designated SEQ ID:37328, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58821] Another function of VGAM1754 is therefore inhibition of LOC139174 (Accession XM\_066525). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139174. LOC148738 (Accession NM\_145277) is another VGAM1754 host target gene. LOC148738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148738 BINDING SITE, designated SEQ ID:29789, to the nucleotide sequence of VGAM1754 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4465.

[58822] Another function of VGAM1754 is therefore inhibition of LOC148738 (Accession NM\_145277). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148738. LOC152059 (Accession XM\_087372) is another VGAM1754 host target gene. LOC152059 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152059 BINDING SITE, designated SEQ ID:39205, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58823] Another function of VGAM1754 is therefore inhibition of LOC152059 (Accession XM\_087372). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152059. LOC154881 (Accession XM\_088063) is another VGAM1754 host target gene. LOC154881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154881, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39500, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58824] Another function of VGAM1754 is therefore inhibition of LOC154881 (Accession XM\_088063). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154881. LOC196759 (Accession XM\_113601) is another VGAM1754 host target gene. LOC196759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196759 BINDING SITE, designated SEQ ID:42291, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58825] Another function of VGAM1754 is therefore inhibition of LOC196759 (Accession XM\_113601). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC196759. LOC220486 (Accession XM\_165391) is another VGAM1754 host target gene. LOC220486 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220486 BINDING SITE, designated SEQ ID:43616, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58826] Another function of VGAM1754 is therefore inhibition of LOC220486 (Accession XM\_165391). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220486. LOC257273 (Accession XM\_170970) is another VGAM1754 host target gene. LOC257273 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257273 BINDING SITE, designated SEQ ID:45745, to

the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58827] Another function of VGAM1754 is therefore inhibition of LOC257273 (Accession XM\_170970). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257273. LOC92573 (Accession XM\_045884) is another VGAM1754 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34592, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58828] Another function of VGAM1754 is therefore inhibition of LOC92573 (Accession XM\_045884). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. LOC96597 (Accession XM\_039922) is another VGAM1754 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33227, to the nucleotide sequence of VGAM1754 RNA, herein designated VGAM RNA, also designated SEQ ID:4465.

[58829] Another function of VGAM1754 is therefore inhibition of LOC96597 (Accession XM\_039922). Accordingly, utilities of VGAM1754 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1755 (VGAM1755) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58830] VGAM1755 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1755 was detected is described hereinabove with reference to Figs. 1-8.

[58831] VGAM1755 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox Virus.

VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58832] VGAM1755 gene encodes a VGAM1755 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1755 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1755 precursor RNA is designated SEQ ID:1741, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1741 is located at position 5746 relative to the genome of Camelpox Virus.

[58833] VGAM1755 precursor RNA folds onto itself, forming VGAM1755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58834] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1755 folded precursor RNA into VGAM1755 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1755 RNA is designated SEQ ID:4466, and is provided hereinbelow with reference to the sequence listing part.

[58835] VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1755 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58836] VGAM1755 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1755 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1755 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58837] The complementary binding of VGAM1755 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1755 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1755

host target RNA into VGAM1755 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58838] It is appreciated that VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1755 host target genes. The mRNA of each one of this plurality of VGAM1755 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1755 RNA, herein designated VGAM RNA, and which when bound by VGAM1755 RNA causes inhibition of translation of respective one or more VGAM1755 host target proteins.

[58839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1755 gene, herein designated VGAM GENE, on one or more VGAM1755 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58840] It is yet further appreciated that a function of VGAM1755 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1755 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1755 correlate with, and may be deduced from, the identity of the host target genes which VGAM1755 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58841] Nucleotide sequences of the VGAM1755 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1755 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1755 are further

described hereinbelow with reference to Table 1.

[58842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1755 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1755 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58843] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1755 gene, herein designated VGAM is inhibition of expression of VGAM1755 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1755 correlate with, and may be deduced from, the identity of the target genes which VGAM1755 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58844] Monoamine Oxidase B (MAOB, Accession XM\_010261) is a VGAM1755 host target gene. MAOB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAOB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAOB BINDING SITE,

designated SEQ ID:30147, to the nucleotide sequence of VGAM1755 RNA, herein designated VGAM RNA, also designated SEQ ID:4466.

[58845] A function of VGAM1755 is therefore inhibition of Monoamine Oxidase B (MAOB, Accession XM\_010261). Accordingly, utilities of VGAM1755 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAOB. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1756 (VGAM1756) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58846] VGAM1756 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1756 was detected is described hereinabove with reference to Figs. 1–8.

[58847] VGAM1756 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58848] VGAM1756 gene encodes a VGAM1756 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1756 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1756 precursor RNA is designated SEQ ID:1742, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1742 is located at position 7373 relative to the genome of Camelpox Virus.

[58849] VGAM1756 precursor RNA folds onto itself, forming VGAM1756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58850] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1756 folded precursor RNA into VGAM1756 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1756 RNA is designated SEQ ID:4467, and is provided hereinbelow with reference to the sequence listing part.

[58851] VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1756 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58852] VGAM1756 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1756 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1756 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58853] The complementary binding of VGAM1756 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1756 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1756 host target RNA into VGAM1756 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58854] It is appreciated that VGAM1756 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1756 host target genes. The mRNA of each one of this plurality of VGAM1756 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1756 RNA, herein designated VGAM RNA, and which when bound by VGAM1756 RNA causes inhibition of translation of respective one or more VGAM1756 host target proteins.

[58855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1756 gene, herein designated VGAM GENE, on one or more VGAM1756 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[58856] It is yet further appreciated that a function of VGAM1756 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1756 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1756 correlate with, and may be deduced from, the identity of the host target genes which VGAM1756 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58857] Nucleotide sequences of the VGAM1756 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1756 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1756 are further described hereinbelow with reference to Table 1.

[58858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1756 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1756 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58859] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1756 gene, herein designated VGAM is inhibition of expression of VGAM1756 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1756 correlate with, and may be deduced from, the identity of the target genes which VGAM1756 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58860] NESG1 (Accession NM\_012337) is a VGAM1756 host target gene. NESG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NESG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NESG1 BINDING SITE, designated SEQ ID:14733, to the nucleotide sequence of VGAM1756 RNA, herein designated VGAM RNA, also designated SEQ ID:4467.

[58861] A function of VGAM1756 is therefore inhibition of NESG1

(Accession NM\_012337). Accordingly, utilities of VGAM1756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NESG1. LOC148638 (Accession XM\_086259) is another VGAM1756 host target gene. LOC148638 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148638 BINDING SITE, designated SEQ ID:38569, to the nucleotide sequence of VGAM1756 RNA, herein designated VGAM RNA, also designated SEQ ID:4467.

[58862] Another function of VGAM1756 is therefore inhibition of LOC148638 (Accession XM\_086259). Accordingly, utilities of VGAM1756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148638. LOC152359 (Accession XM\_098213) is another VGAM1756 host target gene. LOC152359 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152359, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152359 BINDING SITE, designated SEQ ID:41492, to the nucleotide sequence of VGAM1756 RNA, herein designated VGAM RNA, also designated SEQ ID:4467.

[58863] Another function of VGAM1756 is therefore inhibition of LOC152359 (Accession XM\_098213). Accordingly, utilities of VGAM1756 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152359. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1757 (VGAM1757) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58864] VGAM1757 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1757 was detected is described hereinabove with reference to Figs. 1–8.

[58865] VGAM1757 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[58866] VGAM1757 gene encodes a VGAM1757 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1757 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1757 precursor RNA is designated SEQ ID:1743, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1743 is located at position 5203 relative to the genome of Camelpox Virus.

[58867] VGAM1757 precursor RNA folds onto itself, forming VGAM1757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58868] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1757 folded precursor RNA into VGAM1757 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1757 RNA is designated SEQ ID:4468, and is provided hereinbelow with reference to the sequence listing part.

[58869] VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1757 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58870] VGAM1757 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1757 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1757 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58871] The complementary binding of VGAM1757 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1757 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1757 host target RNA into VGAM1757 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58872] It is appreciated that VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1757 host target genes. The mRNA of each one of this plurality of VGAM1757 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1757 RNA, herein designated VGAM RNA, and which when bound by VGAM1757 RNA causes inhibition of translation of respective one or more VGAM1757 host target proteins.

[58873] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1757 gene, herein designated VGAM GENE, on one or more VGAM1757 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58874] It is yet further appreciated that a function of VGAM1757 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1757 correlate with, and may be deduced from, the identity of the host target genes which VGAM1757 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58875] Nucleotide sequences of the VGAM1757 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1757 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1757 are further described hereinbelow with reference to Table 1.

[58876] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1757 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1757 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58877] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1757 gene, herein designated VGAM is inhibition of expression of VGAM1757 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1757 correlate with, and may be deduced from, the identity of the target genes which VGAM1757 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58878] Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM\_020149) is a VGAM1757 host target gene. MEIS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEIS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS2 BINDING SITE, designated SEQ ID:21344, to the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4468.

[58879] A function of VGAM1757 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM\_020149), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2. The function of MEIS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1244.BS69 (Accession NM\_006624) is another VGAM1757 host target gene. BS69 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BS69, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BS69 BINDING SITE, designated SEQ ID:13405, to the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also designated SEQ ID:4468.

[58880] Another function of VGAM1757 is therefore inhibition of BS69 (Accession NM\_006624). Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BS69. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM\_004709) is another VGAM1757 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11053, to the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also designated SEQ ID:4468.

[58881] Another function of VGAM1757 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM\_004709). Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. FLJ21791 (Accession XM\_028958) is another VGAM1757 host target gene. FLJ21791 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ21791 BINDING SITE, designated SEQ ID:30807, to the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also designated SEQ ID:4468.

[58882] Another function of VGAM1757 is therefore inhibition of FLJ21791 (Accession XM\_028958). Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21791. LANO (Accession NM\_025168) is another VGAM1757 host target gene. LANO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANO BINDING SITE, designated SEQ ID:24804, to the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also designated SEQ ID:4468.

[58883] Another function of VGAM1757 is therefore inhibition of LANO (Accession NM\_025168). Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANO. Proteasome (prosome, macropain) Inhibitor Subunit 1

(PI31) (PSMF1, Accession NM\_006814) is another VGAM1757 host target gene. PSMF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSMF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMF1 BINDING SITE, designated SEQ ID:13686, to the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also designated SEQ ID:4468.

[58884] Another function of VGAM1757 is therefore inhibition of Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814). Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMF1. LOC115129 (Accession XM\_055292) is another VGAM1757 host target gene. LOC115129 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36249, to

the nucleotide sequence of VGAM1757 RNA, herein designated VGAM RNA, also designated SEQ ID:4468.

[58885] Another function of VGAM1757 is therefore inhibition of LOC115129 (Accession XM\_055292). Accordingly, utilities of VGAM1757 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1758 (VGAM1758) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58886] VGAM1758 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1758 was detected is described hereinabove with reference to Figs. 1–8.

[58887] VGAM1758 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58888] VGAM1758 gene encodes a VGAM1758 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1758 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1758 precursor RNA is designated SEQ ID:1744, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1744 is located at position 60 relative to the genome of Camelpox Virus.

[58889] VGAM1758 precursor RNA folds onto itself, forming VGAM1758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58890] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1758 folded precursor RNA into VGAM1758 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1758 RNA is designated SEQ ID:4469, and is provided hereinbelow with reference to the sequence listing part.

[58891] VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1758 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58892] VGAM1758 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1758 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1758 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58893] The complementary binding of VGAM1758 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1758 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1758 host target RNA into VGAM1758 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58894] It is appreciated that VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1758 host target genes. The mRNA of each one of this plurality of VGAM1758 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1758 RNA, herein designated VGAM RNA, and which when bound by VGAM1758 RNA causes inhibition of translation of respective one or more VGAM1758 host target proteins.

[58895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1758 gene, herein designated VGAM GENE, on one or more VGAM1758 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[58896] It is yet further appreciated that a function of VGAM1758 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1758 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1758 correlate with, and may be deduced from, the identity of the host target genes which VGAM1758 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58897] Nucleotide sequences of the VGAM1758 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1758 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1758 are further described hereinbelow with reference to Table 1.

[58898] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1758 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1758 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58899] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1758 gene, herein designated VGAM is inhibition of expression of VGAM1758 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1758 correlate with, and may be deduced from, the identity of the target genes which VGAM1758 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58900] LOC152078 (Accession XM\_087376) is a VGAM1758 host target gene. LOC152078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152078 BINDING SITE, designated SEQ ID:39213, to the nucleotide sequence of VGAM1758 RNA, herein designated VGAM RNA, also designated SEQ ID:4469.

[58901] A function of VGAM1758 is therefore inhibition of LOC152078 (Accession XM\_087376). Accordingly, utilities

of VGAM1758 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1759 (VGAM1759) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58902] VGAM1759 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1759 was detected is described hereinabove with reference to Figs. 1–8.

[58903] VGAM1759 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2). VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58904] VGAM1759 gene encodes a VGAM1759 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1759 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1759 precursor RNA is designated SEQ ID:1745, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1745 is located at position 12109 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2).

- [58905] VGAM1759 precursor RNA folds onto itself, forming VGAM1759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [58906] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1759 folded precursor RNA into VGAM1759 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide se-

quence of VGAM1759 RNA is designated SEQ ID:4470, and is provided hereinbelow with reference to the sequence listing part.

[58907] VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1759 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58908] VGAM1759 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1759 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1759 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[58909] The complementary binding of VGAM1759 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1759 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1759 host target RNA into VGAM1759 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58910] It is appreciated that VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1759 host target genes. The mRNA of each one of this plurality of VGAM1759 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1759 RNA, herein designated VGAM RNA, and which when bound by VGAM1759 RNA causes inhibition of translation of respective one or more VGAM1759 host target proteins.

[58911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1759 gene, herein designated VGAM GENE, on one or more VGAM1759 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58912] It is yet further appreciated that a function of VGAM1759

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1759 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1759 correlate with, and may be deduced from, the identity of the host target genes which VGAM1759 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58913] Nucleotide sequences of the VGAM1759 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1759 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1759 are further described hereinbelow with reference to Table 1.

[58914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1759 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1759 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58915] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1759 gene, herein designated VGAM is inhibition of expression of VGAM1759 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1759 correlate with, and may be deduced from, the identity of the target genes which VGAM1759 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58916] ADG-90 (Accession NM\_033069) is a VGAM1759 host target gene. ADG-90 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADG-90, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADG-90 BINDING SITE, designated SEQ ID:26934, to the nucleotide sequence of VGAM1759 RNA, herein designated VGAM RNA, also designated SEQ ID:4470.

[58917] A function of VGAM1759 is therefore inhibition of ADG-90 (Accession NM\_033069). Accordingly, utilities of VGAM1759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADG-90. NEU4 (Accession NM\_080741) is another VGAM1759

host target gene. NEU4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEU4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU4 BINDING SITE, designated SEQ ID:28026, to the nucleotide sequence of VGAM1759 RNA, herein designated VGAM RNA, also designated SEQ ID:4470.

[58918] Another function of VGAM1759 is therefore inhibition of NEU4 (Accession NM\_080741). Accordingly, utilities of VGAM1759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU4. LOC149535 (Accession XM\_086567) is another VGAM1759 host target gene. LOC149535 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149535 BINDING SITE, designated SEQ ID:38771, to the nucleotide sequence of VGAM1759 RNA, herein designated VGAM RNA, also designated SEQ ID:4470.

[58919] Another function of VGAM1759 is therefore inhibition of LOC149535 (Accession XM\_086567). Accordingly, utilities of VGAM1759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149535. LOC200301 (Accession XM\_114197) is another VGAM1759 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42779, to the nucleotide sequence of VGAM1759 RNA, herein designated VGAM RNA, also designated SEQ ID:4470.

[58920] Another function of VGAM1759 is therefore inhibition of LOC200301 (Accession XM\_114197). Accordingly, utilities of VGAM1759 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1760 (VGAM1760) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[58921] VGAM1760 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1760 was detected is described hereinabove with reference to Figs. 1–8.

[58922] VGAM1760 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2). VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58923] VGAM1760 gene encodes a VGAM1760 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1760 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1760 precursor RNA is designated SEQ ID:1746, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1746 is located at position 7567 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2).

[58924] VGAM1760 precursor RNA folds onto itself, forming

VGAM1760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58925] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1760 folded precursor RNA into VGAM1760 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1760 RNA is designated SEQ ID:4471, and is provided hereinbelow with reference to the sequence listing part.

[58926] VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1760 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58927] VGAM1760 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1760 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1760 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[58928] The complementary binding of VGAM1760 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1760 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1760 host target RNA into VGAM1760 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58929] It is appreciated that VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1760 host target genes. The mRNA of each one of this plurality of VGAM1760 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1760 RNA, herein designated VGAM RNA, and which when bound by VGAM1760 RNA causes inhibition of translation of respective one or more VGAM1760 host target proteins.

[58930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1760 gene, herein designated VGAM GENE, on one or more VGAM1760 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58931] It is yet further appreciated that a function of VGAM1760 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1760 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1760 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58932] Nucleotide sequences of the VGAM1760 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1760 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1760 are further described hereinbelow with reference to Table 1.

[58933] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1760 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1760 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58934] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1760 gene, herein designated VGAM is inhibition of expression of VGAM1760 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1760 correlate with, and may be deduced from, the identity of the target genes which VGAM1760 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[58935] Cartilage Acidic Protein 1 (CRTAC1, Accession NM\_018058) is a VGAM1760 host target gene. CRTAC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRTAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAC1 BINDING SITE, designated SEQ ID:19826, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58936] A function of VGAM1760 is therefore inhibition of Cartilage Acidic Protein 1 (CRTAC1, Accession NM\_018058). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAC1. DKFZP434J193 (Accession XM\_048452) is another VGAM1760 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZP434J193 BINDING SITE, designated SEQ ID:35160, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58937] Another function of VGAM1760 is therefore inhibition of DKFZP434J193 (Accession XM\_048452). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. Methylene Tetrahydrofolate Dehydrogenase (NAD<sup>+</sup> dependent), Methenyltetrahydrofolate Cyclohydrolase (MTHFD2, Accession NM\_006636) is another VGAM1760 host target gene. MTHFD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTHFD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTHFD2 BINDING SITE, designated SEQ ID:13430, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58938] Another function of VGAM1760 is therefore inhibition of Methylene Tetrahydrofolate Dehydrogenase (NAD<sup>+</sup> dependent), Methenyltetrahydrofolate Cyclohydrolase

(MTHFD2, Accession NM\_006636). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTHFD2. SMC1 Structural Maintenance of Chromosomes 1-like 1 (yeast) (SMC1L1, Accession XM\_050403) is another VGAM1760 host target gene. SMC1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMC1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMC1L1 BINDING SITE, designated SEQ ID:35616, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58939] Another function of VGAM1760 is therefore inhibition of SMC1 Structural Maintenance of Chromosomes 1-like 1 (yeast) (SMC1L1, Accession XM\_050403). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMC1L1. LOC145483 (Accession XM\_085156) is another VGAM1760 host target gene. LOC145483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145483, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145483 BINDING SITE, designated SEQ ID:37881, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58940] Another function of VGAM1760 is therefore inhibition of LOC145483 (Accession XM\_085156). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145483. LOC158476 (Accession XM\_098955) is another VGAM1760 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41996, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58941] Another function of VGAM1760 is therefore inhibition of LOC158476 (Accession XM\_098955). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158476. LOC161823 (Accession XM\_091156) is another VGAM1760 host target gene. LOC161823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161823 BINDING SITE, designated SEQ ID:40032, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58942] Another function of VGAM1760 is therefore inhibition of LOC161823 (Accession XM\_091156). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161823. LOC164295 (Accession XM\_092767) is another VGAM1760 host target gene. LOC164295 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164295 BINDING SITE, designated SEQ ID:40140, to

the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58943] Another function of VGAM1760 is therefore inhibition of LOC164295 (Accession XM\_092767). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164295. LOC92661 (Accession XM\_046465) is another VGAM1760 host target gene. LOC92661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34725, to the nucleotide sequence of VGAM1760 RNA, herein designated VGAM RNA, also designated SEQ ID:4471.

[58944] Another function of VGAM1760 is therefore inhibition of LOC92661 (Accession XM\_046465). Accordingly, utilities of VGAM1760 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1761 (VGAM1761) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58945] VGAM1761 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1761 was detected is described hereinabove with reference to Figs. 1–8.

[58946] VGAM1761 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2). VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58947] VGAM1761 gene encodes a VGAM1761 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1761 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1761 precursor RNA is designated SEQ ID:1747, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1747 is located at position 11998 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2

(BVDV-2).

[58948] VGAM1761 precursor RNA folds onto itself, forming VGAM1761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[58949] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1761 folded precursor RNA into VGAM1761 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1761 RNA is designated SEQ ID:4472, and is provided hereinbelow with reference to the sequence listing part.

[58950] VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1761 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[58951] VGAM1761 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1761 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1761 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[58952] The complementary binding of VGAM1761 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1761 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1761 host target RNA into VGAM1761 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[58953] It is appreciated that VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1761 host target genes. The mRNA of each one of this plurality of VGAM1761 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1761 RNA, herein designated VGAM RNA, and which when bound by VGAM1761 RNA causes inhibition of translation of respective one or more VGAM1761 host target proteins.

[58954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1761 gene, herein designated VGAM GENE, on one or more VGAM1761 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[58955] It is yet further appreciated that a function of VGAM1761 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly

utilities, of VGAM1761 correlate with, and may be deduced from, the identity of the host target genes which VGAM1761 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[58956] Nucleotide sequences of the VGAM1761 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1761 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1761 are further described hereinbelow with reference to Table 1.

[58957] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1761 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1761 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[58958] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1761 gene, herein designated VGAM is inhibition of expression of VGAM1761 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1761 correlate with, and may be deduced

from, the identity of the target genes which VGAM1761 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[58959] Absent In Melanoma 1 (AIM1, Accession XM\_166300) is a VGAM1761 host target gene. AIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIM1 BINDING SITE, designated SEQ ID:44115, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58960] A function of VGAM1761 is therefore inhibition of Absent In Melanoma 1 (AIM1, Accession XM\_166300), a gene which interactions with the cytoskeleton. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIM1. The function of AIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM808. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 6 (CHST6,

Accession NM\_021615) is another VGAM1761 host target gene. CHST6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST6 BINDING SITE, designated SEQ ID:22247, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58961] Another function of VGAM1761 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 6 (CHST6, Accession NM\_021615). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST6. Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228) is another VGAM1761 host target gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of EGFR BINDING SITE, designated SEQ ID:11725, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58962] Another function of VGAM1761 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Growth Factor Receptor-bound Protein 14 (GRB14, Accession NM\_004490) is another VGAM1761 host target gene. GRB14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GRB14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRB14 BINDING SITE, designated SEQ ID:10829, to the nucleotide se-

quence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58963] Another function of VGAM1761 is therefore inhibition of Growth Factor Receptor-bound Protein 14 (GRB14, Accession NM\_004490), a gene which may interact with platelet-derived growth factor receptor (PDGFRB). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRB14. The function of GRB14 has been established by previous studies. Daly et al. (1996) screened a human breast epithelial cell cDNA library with the tyrosine-phosphorylated C terminus of the epidermal growth factor receptor (EGFR) and identified GRB14. GRB14 is a member of the GRB7 family, whose members include the mouse genes Grb7 (OMIM Ref. No. 601522) and Grb10 (OMIM Ref. No. 601523). GRB14, Grb7 and Grb10 all contain a C-terminal SH2 domain and a central domain with similarity to the *C. elegans* protein F10E9.6/mig10. Daly et al. (1996) identified a third region of similarity, an N-terminal motif, P(S/A)IPNPFPEL, which contains the consensus PXXP SH3 binding domain, suggesting that an SH3 protein may bind to these proteins. By sequence analysis, Dong et al. (1997) mapped the GRB14 gene to chromo-

some 2.

[58964] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[58965] Daly, R. J.; Sanderson, G. M.; Janes, P. W.; Sutherland, R. L. : Cloning and characterization of GRB14, a novel member of the GRB7 gene family. J. Biol. Chem. 271: 12502–12510, 1996. ; and

[58966] Dong, L. Q.; Du, H.; Porter, S. G.; Kolakowski, L. F., Jr.; Lee, A. V.; Mandarino, J.; Fan, J.; Yee, D.; Liu, F. : Cloning, chromosome localization, expression, and characterization of.

[58967] Further studies establishing the function and utilities of GRB14 are found in John Hopkins OMIM database record ID 601524, and in cited publications numbered 6532 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. IRTA2 (Accession NM\_031281) is another VGAM1761 host target gene. IRTA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of IRTA2 BINDING SITE, designated SEQ ID:25300, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58968] Another function of VGAM1761 is therefore inhibition of IRTA2 (Accession NM\_031281), a gene which binds to the fc region of immunoglobulins gamma low affinity receptor. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA2. The function of IRTA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Promyelocytic Leukemia (PML, Accession NM\_033238) is another VGAM1761 host target gene. PML BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PML, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE, designated SEQ ID:27078, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58969] Another function of VGAM1761 is therefore inhibition of

Promyelocytic Leukemia (PML, Accession NM\_033238). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PML. Peanut-like 2 (Drosophila) (PNUTL2, Accession NM\_080415) is another VGAM1761 host target gene. PNUTL2 BINDING SITE1 and PNUTL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PNUTL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNUTL2 BINDING SITE1 and PNUTL2 BINDING SITE2, designated SEQ ID:27834 and SEQ ID:27838 respectively, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58970] Another function of VGAM1761 is therefore inhibition of Peanut-like 2 (Drosophila) (PNUTL2, Accession NM\_080415), a gene which is involved in cytokinesis. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNUTL2. The function of PNUTL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM95. Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, Accession XM\_165823) is another VGAM1761 host target gene. TNF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNF BINDING SITE, designated SEQ ID:43770, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58971] Another function of VGAM1761 is therefore inhibition of Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, Accession XM\_165823), a gene which mediates proinflammatory responses and apoptosis. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNF. The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Tripartite Motif-containing 8 (TRIM8, Accession NM\_030912) is another VGAM1761 host target gene. TRIM8 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by TRIM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM8 BINDING SITE, designated SEQ ID:25182, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58972] Another function of VGAM1761 is therefore inhibition of Tripartite Motif-containing 8 (TRIM8, Accession NM\_030912). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM8. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662) is another VGAM1761 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19200, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ

ID:4472.

[58973] Another function of VGAM1761 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Ubiquitin Specific Protease 6 (Ure-2 oncogene) (USP6, Accession XM\_165948) is another VGAM1761 host target gene. USP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP6 BINDING SITE, designated SEQ ID:43811, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58974] Another function of VGAM1761 is therefore inhibition of

Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM\_165948), a gene which has an atp-independent isopeptidase activity, cleaving at the carboxyl terminus of the ubiquitin moiety. Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP6. The function of USP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM296.DKFZP434L0718 (Accession NM\_032139) is another VGAM1761 host target gene. DKFZP434L0718 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434L0718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L0718 BINDING SITE, designated SEQ ID:25822, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58975] Another function of VGAM1761 is therefore inhibition of DKFZP434L0718 (Accession NM\_032139). Accordingly, utilities of VGAM1761 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434L0718. FLJ14596 (Accession NM\_032809) is another VGAM1761 host target gene. FLJ14596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14596 BINDING SITE, designated SEQ ID:26572, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58976] Another function of VGAM1761 is therefore inhibition of FLJ14596 (Accession NM\_032809). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14596. FLJ21276 (Accession NM\_024633) is another VGAM1761 host target gene. FLJ21276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21276 BINDING SITE, designated SEQ ID:23905, to the nucleotide

sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58977] Another function of VGAM1761 is therefore inhibition of FLJ21276 (Accession NM\_024633). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21276. HSH2 (Accession NM\_032855) is another VGAM1761 host target gene. HSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSH2 BINDING SITE, designated SEQ ID:26654, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58978] Another function of VGAM1761 is therefore inhibition of HSH2 (Accession NM\_032855). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSH2. KR18 (Accession NM\_033288) is another VGAM1761 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27114, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58979] Another function of VGAM1761 is therefore inhibition of KR18 (Accession NM\_033288). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010) is another VGAM1761 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8919, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58980] Another function of VGAM1761 is therefore inhibition of

Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. NPD009 (Accession XM\_170795) is another VGAM1761 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPD009 BINDING SITE, designated SEQ ID:45563, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58981] Another function of VGAM1761 is therefore inhibition of NPD009 (Accession XM\_170795). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Triple Homeobox 1 (TIX1, Accession XM\_029734) is another VGAM1761 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:30929, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58982] Another function of VGAM1761 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM\_029734). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1. LOC129198 (Accession XM\_072197) is another VGAM1761 host target gene. LOC129198 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129198 BINDING SITE, designated SEQ ID:37464, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58983] Another function of VGAM1761 is therefore inhibition of LOC129198 (Accession XM\_072197). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC129198. LOC143310 (Accession XM\_084485) is another VGAM1761 host target gene. LOC143310 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:37609, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58984] Another function of VGAM1761 is therefore inhibition of LOC143310 (Accession XM\_084485). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. LOC145453 (Accession XM\_085120) is another VGAM1761 host target gene. LOC145453 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145453 BINDING SITE, designated SEQ ID:37837, to

the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58985] Another function of VGAM1761 is therefore inhibition of LOC145453 (Accession XM\_085120). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145453. LOC150159 (Accession NM\_139173) is another VGAM1761 host target gene. LOC150159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150159 BINDING SITE, designated SEQ ID:29181, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58986] Another function of VGAM1761 is therefore inhibition of LOC150159 (Accession NM\_139173). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150159. LOC150967 (Accession XM\_087060) is another VGAM1761 host target gene. LOC150967 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150967 BINDING SITE, designated SEQ ID:39037, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58987] Another function of VGAM1761 is therefore inhibition of LOC150967 (Accession XM\_087060). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150967. LOC152345 (Accession XM\_087442) is another VGAM1761 host target gene. LOC152345 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152345 BINDING SITE, designated SEQ ID:39267, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58988] Another function of VGAM1761 is therefore inhibition of LOC152345 (Accession XM\_087442). Accordingly, utilities

of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152345. LOC168576 (Accession XM\_095191) is another VGAM1761 host target gene. LOC168576 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168576 BINDING SITE, designated SEQ ID:40253, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58989] Another function of VGAM1761 is therefore inhibition of LOC168576 (Accession XM\_095191). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168576. LOC200312 (Accession XM\_117224) is another VGAM1761 host target gene. LOC200312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200312 BINDING SITE, designated SEQ ID:43291, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58990] Another function of VGAM1761 is therefore inhibition of LOC200312 (Accession XM\_117224). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200312. LOC203350 (Accession XM\_117536) is another VGAM1761 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43535, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58991] Another function of VGAM1761 is therefore inhibition of LOC203350 (Accession XM\_117536). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC220776 (Accession XM\_043388) is another VGAM1761 host target gene. LOC220776 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33936, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58992] Another function of VGAM1761 is therefore inhibition of LOC220776 (Accession XM\_043388). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC257551 (Accession XM\_175158) is another VGAM1761 host target gene. LOC257551 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257551, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257551 BINDING SITE, designated SEQ ID:46644, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58993] Another function of VGAM1761 is therefore inhibition of

LOC257551 (Accession XM\_175158). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257551. LOC257601 (Accession XM\_175231) is another VGAM1761 host target gene. LOC257601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257601 BINDING SITE, designated SEQ ID:46695, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58994] Another function of VGAM1761 is therefore inhibition of LOC257601 (Accession XM\_175231). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257601. LOC91585 (Accession XM\_039395) is another VGAM1761 host target gene. LOC91585 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91585, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91585 BINDING SITE, designated SEQ ID:33077, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58995] Another function of VGAM1761 is therefore inhibition of LOC91585 (Accession XM\_039395). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91585. LOC93624 (Accession XM\_052624) is another VGAM1761 host target gene. LOC93624 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93624 BINDING SITE, designated SEQ ID:36016, to the nucleotide sequence of VGAM1761 RNA, herein designated VGAM RNA, also designated SEQ ID:4472.

[58996] Another function of VGAM1761 is therefore inhibition of LOC93624 (Accession XM\_052624). Accordingly, utilities of VGAM1761 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93624. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1762 (VGAM1762) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[58997] VGAM1762 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1762 was detected is described hereinabove with reference to Figs. 1–8.

[58998] VGAM1762 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2). VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[58999] VGAM1762 gene encodes a VGAM1762 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1762 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1762 precursor RNA is designated SEQ ID:1748, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1748 is located at position 2442 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2).

- [59000] VGAM1762 precursor RNA folds onto itself, forming VGAM1762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [59001] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1762 folded precursor RNA into VGAM1762 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1762 RNA is designated SEQ ID:4473, and is provided hereinbelow with reference to the sequence listing part.

[59002] VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1762 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59003] VGAM1762 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1762 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1762 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59004] The complementary binding of VGAM1762 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1762 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1762 host target RNA into VGAM1762 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59005] It is appreciated that VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1762 host target genes. The mRNA of each one of this plurality of VGAM1762 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1762 RNA, herein designated VGAM RNA, and which when bound by VGAM1762 RNA causes

inhibition of translation of respective one or more VGAM1762 host target proteins.

[59006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1762 gene, herein designated VGAM GENE, on one or more VGAM1762 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59007] It is yet further appreciated that a function of VGAM1762 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1762 include diagnosis, prevention and

treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1762 correlate with, and may be deduced from, the identity of the host target genes which VGAM1762 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59008] Nucleotide sequences of the VGAM1762 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1762 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1762 are further described hereinbelow with reference to Table 1.

[59009] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1762 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1762 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59010] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1762 gene, herein designated VGAM is inhibition of expression of VGAM1762 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1762 correlate with, and may be deduced from, the identity of the target genes which VGAM1762 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59011] Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025) is a VGAM1762 host target gene. ADRB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRB3 BINDING SITE, designated SEQ ID:5460, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also designated SEQ ID:4473.

[59012] A function of VGAM1762 is therefore inhibition of Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025), a gene which stimulates adenylyl cyclase activity and regulates lipolysis. Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRB3. The function of ADRB3 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM179. Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141) is another VGAM1762 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15419, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also designated SEQ ID:4473.

[59013] Another function of VGAM1762 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141). Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. FLJ22746 (Accession NM\_024785) is another VGAM1762 host target gene. FLJ22746 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ22746 BINDING SITE, designated SEQ ID:24165, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also designated SEQ ID:4473.

[59014] Another function of VGAM1762 is therefore inhibition of FLJ22746 (Accession NM\_024785). Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22746. SQV7L (Accession XM\_047287) is another VGAM1762 host target gene. SQV7L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SQV7L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SQV7L BINDING SITE, designated SEQ ID:34933, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also designated SEQ ID:4473.

[59015] Another function of VGAM1762 is therefore inhibition of SQV7L (Accession XM\_047287). Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SQV7L. Zinc Finger Protein 237 (ZNF237, Accession NM\_014242)

is another VGAM1762 host target gene. ZNF237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF237 BINDING SITE, designated SEQ ID:15505, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also designated SEQ ID:4473.

[59016] Another function of VGAM1762 is therefore inhibition of Zinc Finger Protein 237 (ZNF237, Accession NM\_014242). Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF237. LOC153688 (Accession XM\_098416) is another VGAM1762 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41653, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4473.

[59017] Another function of VGAM1762 is therefore inhibition of LOC153688 (Accession XM\_098416). Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC220846 (Accession XM\_165515) is another VGAM1762 host target gene. LOC220846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220846 BINDING SITE, designated SEQ ID:43662, to the nucleotide sequence of VGAM1762 RNA, herein designated VGAM RNA, also designated SEQ ID:4473.

[59018] Another function of VGAM1762 is therefore inhibition of LOC220846 (Accession XM\_165515). Accordingly, utilities of VGAM1762 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220846. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1763 (VGAM1763) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59019] VGAM1763 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1763 was detected is described hereinabove with reference to Figs. 1–8.

[59020] VGAM1763 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2). VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59021] VGAM1763 gene encodes a VGAM1763 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1763 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1763 precursor RNA is designated SEQ ID:1749, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1749 is located at position 11479 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV–2).

[59022] VGAM1763 precursor RNA folds onto itself, forming VGAM1763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59023] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1763 folded precursor RNA into VGAM1763 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1763 RNA is designated SEQ ID:4474, and is provided hereinbelow with reference to the sequence listing part.

[59024] VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1763 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1763 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59025] VGAM1763 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1763 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1763 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59026] The complementary binding of VGAM1763 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1763 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1763 host target RNA into VGAM1763 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59027] It is appreciated that VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1763 host target genes. The mRNA of each one of this plurality of VGAM1763 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1763 RNA, herein designated VGAM RNA, and which when bound by VGAM1763 RNA causes inhibition of translation of respective one or more VGAM1763 host target proteins.

[59028] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1763 gene, herein designated VGAM GENE, on one or more VGAM1763 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59029] It is yet further appreciated that a function of VGAM1763 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1763 correlate with, and may be de-

duced from, the identity of the host target genes which VGAM1763 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59030] Nucleotide sequences of the VGAM1763 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1763 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1763 are further described hereinbelow with reference to Table 1.

[59031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1763 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1763 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59032] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1763 gene, herein designated VGAM is inhibition of expression of VGAM1763 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1763 correlate with, and may be deduced from, the identity of the target genes which VGAM1763

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59033] Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM\_001883) is a VGAM1763 host target gene. CRHR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRHR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR2 BINDING SITE, designated SEQ ID:7613, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59034] A function of VGAM1763 is therefore inhibition of Corticotropin Releasing Hormone Receptor 2 (CRHR2, Accession NM\_001883), a gene which is a corticotropin releasing factor receptor type II. Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR2. The function of CRHR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737. Dual Specificity Phosphatase 6 (DUSP6, Ac-

cession XM\_038308) is another VGAM1763 host target gene. DUSP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP6 BINDING SITE, designated SEQ ID:32810, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59035] Another function of VGAM1763 is therefore inhibition of Dual Specificity Phosphatase 6 (DUSP6, Accession XM\_038308), a gene which inactivates map kinases. Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP6. The function of DUSP6 has been established by previous studies. Members of the mitogen-activated protein (MAP) kinase family play a pivotal role in cellular signal transduction. The dual-specificity phosphatases can reverse MAP kinase activation by dephosphorylating critical phosphotyrosine and phosphothreonine residues. Muda et al. (1996) identified rat superior cervical ganglion cDNAs encoding 2 dual-specificity phos-

phatases that they designated MKP3 and MKPX (OMIM Ref. No. 602749). Northern analysis revealed that nerve growth factor (see OMIM Ref. No. 162030) induced MKP3 expression in PC12 cells. By in situ hybridization, Muda et al. (1996) showed that metrazole-stimulated seizure activity induced MKP3 expression, rapidly and transiently, in specific regions of the brain. When expressed in mammalian cells, MKP3 blocked both the phosphorylation and enzymatic activation of the MAP kinase ERK2 (OMIM Ref. No. 176948) by mitogens. Muda et al. (1996) concluded that MKP3 may play an important and specific role in regulating MAP kinase activities. Groom et al. (1996) identified cDNAs encoding the human MKP3 and MKPX homologs, which they called PYST1 and PYST2, respectively. Like other dual-specificity phosphatases, the N-terminal region of the predicted 381-amino acid PYST1 protein has 2 domains with significant homology to CDC25 (OMIM Ref. No. 157680). By immunofluorescence of mammalian cells expressing epitope-tagged PYST1, Groom et al. (1996) showed that the protein is localized to the cytoplasm. They found that PYST1 dephosphorylated and inactivated MAP kinase in vitro and in vivo, but displayed very low activity towards the related stress-activated pro-

tein kinases (SAPKs; OMIM Ref. No. 601158). When expressed in mammalian cells, PYST1 formed a physical complex with endogenous MAP kinase. Northern analysis revealed that PYST1 is expressed as a 3-kb mRNA in a variety of tissues, with the highest levels in heart and pancreas. By RT-PCR, Furukawa et al. (1998) found that DUSP6 was expressed as 2 differently sized transcripts in all tissues tested.

[59036] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59037] Groom, L. A.; Sneddon, A. A.; Alessi, D. R.; Dowd, S.; Keyse, S. M. : Differential regulation of the MAP, SAP and RK/p38 kinases by Pyst1, a novel cytosolic dual-specificity phosphatase. EMBO J. 15: 3621-3632, 1996. ; and

[59038] Muda, M.; Boschert, U.; Dickinson, R.; Martinou, J.-C.; Martinou, I.; Camps, M.; Schlegel, W.; Arkinstall, S. : MKP-3, a novel cytosolic protein-tyrosine phosphatase that exemplifies a.

[59039] Further studies establishing the function and utilities of DUSP6 are found in John Hopkins OMIM database record ID 602748, and in cited publications numbered 2410-241 and 2409 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_033300) is another VGAM1763 host target gene. LRP8 BINDING SITE1 and LRP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LRP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP8 BINDING SITE1 and LRP8 BINDING SITE2, designated SEQ ID:27130 and SEQ ID:11006 respectively, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59040] Another function of VGAM1763 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 8, Apolipoprotein E Receptor (LRP8, Accession NM\_033300), a gene which binds vldl and transports it into cells by endocytosis. Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP8. The function of LRP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Cell Ad-

hesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614) is another VGAM1763 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13398, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59041] Another function of VGAM1763 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. DJ167A19.1 (Accession NM\_018982) is another VGAM1763 host target gene. DJ167A19.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ167A19.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of DJ167A19.1 BINDING SITE, designated SEQ ID:21051, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59042] Another function of VGAM1763 is therefore inhibition of DJ167A19.1 (Accession NM\_018982). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ167A19.1. FLJ22054 (Accession XM\_170478) is another VGAM1763 host target gene. FLJ22054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22054 BINDING SITE, designated SEQ ID:45318, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59043] Another function of VGAM1763 is therefore inhibition of FLJ22054 (Accession XM\_170478). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22054. GFR (Accession NM\_012294) is another VGAM1763 host target gene. GFR BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14643, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59044] Another function of VGAM1763 is therefore inhibition of GFR (Accession NM\_012294). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. Histone Deacetylase 11 (HDAC11, Accession NM\_024827) is another VGAM1763 host target gene. HDAC11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC11 BINDING SITE, designated SEQ ID:24218, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59045] Another function of VGAM1763 is therefore inhibition of

Histone Deacetylase 11 (HDAC11, Accession NM\_024827). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC11. KIAA0415 (Accession XM\_166527) is another VGAM1763 host target gene. KIAA0415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0415 BINDING SITE, designated SEQ ID:44475, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59046] Another function of VGAM1763 is therefore inhibition of KIAA0415 (Accession XM\_166527). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415. KIAA0978 (Accession XM\_047013) is another VGAM1763 host target gene. KIAA0978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0978, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0978 BINDING SITE, designated SEQ ID:34888, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59047] Another function of VGAM1763 is therefore inhibition of KIAA0978 (Accession XM\_047013). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0978. KIAA1042 (Accession NM\_014965) is another VGAM1763 host target gene. KIAA1042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1042 BINDING SITE, designated SEQ ID:17354, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59048] Another function of VGAM1763 is therefore inhibition of KIAA1042 (Accession NM\_014965). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1042. KIAA1045 (Accession XM\_048592) is another VGAM1763 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35201, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59049] Another function of VGAM1763 is therefore inhibition of KIAA1045 (Accession XM\_048592). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. MGC12760 (Accession NM\_032723) is another VGAM1763 host target gene. MGC12760 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12760 BINDING SITE, designated SEQ ID:26451, to the nucleotide sequence of VGAM1763 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4474.

[59050] Another function of VGAM1763 is therefore inhibition of MGC12760 (Accession NM\_032723). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12760. PRO0800 (Accession NM\_018592) is another VGAM1763 host target gene. PRO0800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0800 BINDING SITE, designated SEQ ID:20672, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59051] Another function of VGAM1763 is therefore inhibition of PRO0800 (Accession NM\_018592). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0800. SQV7L (Accession XM\_047287) is another VGAM1763 host target gene. SQV7L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SQV7L, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SQV7L BINDING SITE, designated SEQ ID:34934, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59052] Another function of VGAM1763 is therefore inhibition of SQV7L (Accession XM\_047287). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SQV7L. LOC170082 (Accession XM\_093092) is another VGAM1763 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:40171, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59053] Another function of VGAM1763 is therefore inhibition of LOC170082 (Accession XM\_093092). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC170082. LOC221687 (Accession XM\_166423) is another VGAM1763 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44308, to the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59054] Another function of VGAM1763 is therefore inhibition of LOC221687 (Accession XM\_166423). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. LOC255862 (Accession XM\_170505) is another VGAM1763 host target gene. LOC255862 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255862 BINDING SITE, designated SEQ ID:45343, to

the nucleotide sequence of VGAM1763 RNA, herein designated VGAM RNA, also designated SEQ ID:4474.

[59055] Another function of VGAM1763 is therefore inhibition of LOC255862 (Accession XM\_170505). Accordingly, utilities of VGAM1763 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255862. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1764 (VGAM1764) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59056] VGAM1764 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1764 was detected is described hereinabove with reference to Figs. 1–8.

[59057] VGAM1764 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59058] VGAM1764 gene encodes a VGAM1764 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1764 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1764 precursor RNA is designated SEQ ID:1750, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1750 is located at position 3861 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2).

[59059] VGAM1764 precursor RNA folds onto itself, forming VGAM1764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59060] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1764 folded precursor RNA into VGAM1764 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1764 RNA is designated SEQ ID:4475, and is provided hereinbelow with reference to the sequence listing part.

[59061] VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1764 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59062] VGAM1764 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1764 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1764 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59063] The complementary binding of VGAM1764 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1764 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1764 host target RNA into VGAM1764 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59064] It is appreciated that VGAM1764 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1764 host target genes. The mRNA of each one of this plurality of VGAM1764 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1764 RNA, herein designated VGAM RNA, and which when bound by VGAM1764 RNA causes inhibition of translation of respective one or more VGAM1764 host target proteins.

[59065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1764 gene, herein designated VGAM GENE, on one or more VGAM1764 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[59066] It is yet further appreciated that a function of VGAM1764 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1764 correlate with, and may be deduced from, the identity of the host target genes which VGAM1764 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59067] Nucleotide sequences of the VGAM1764 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1764 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1764 are further described hereinbelow with reference to Table 1.

[59068] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1764 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1764 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59069] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1764 gene, herein designated VGAM is inhibition of expression of VGAM1764 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1764 correlate with, and may be deduced from, the identity of the target genes which VGAM1764 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59070] EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is a VGAM1764 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41877, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59071] A function of VGAM1764 is therefore inhibition of EGF-

like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Protocadherin Beta 16 (PCDHB16, Accession NM\_020957) is another VGAM1764 host target gene. PCDHB16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCDHB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB16 BINDING SITE, designated SEQ ID:21948, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59072] Another function of VGAM1764 is therefore inhibition of Protocadherin Beta 16 (PCDHB16, Accession NM\_020957), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB16. The function of PCDHB16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM931.Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788) is another VGAM1764 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE, designated SEQ ID:16669, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59073] Another function of VGAM1764 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788), a gene which is composed of 3 zinc-binding domains and is involved in development and cell growth. Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Cyclin E2 (CCNE2, Accession NM\_004702) is another VGAM1764 host target gene. CCNE2 BINDING SITE1 and CCNE2 BIND-

ING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCNE2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNE2 BINDING SITE1 and CCNE2 BINDING SITE2, designated SEQ ID:11048 and SEQ ID:27709 respectively, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59074] Another function of VGAM1764 is therefore inhibition of Cyclin E2 (CCNE2, Accession NM\_004702). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNE2. DKFZP566F2124 (Accession NM\_015630) is another VGAM1764 host target gene. DKFZP566F2124 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566F2124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566F2124 BINDING SITE, designated SEQ ID:17889, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4475.

[59075] Another function of VGAM1764 is therefore inhibition of DKFZP566F2124 (Accession NM\_015630). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566F2124. Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665) is another VGAM1764 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12214, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59076] Another function of VGAM1764 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM\_005665). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. KIAA0368 (Accession XM\_036708) is another VGAM1764 host target gene. KIAA0368 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by KIAA0368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0368 BINDING SITE, designated SEQ ID:32489, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59077] Another function of VGAM1764 is therefore inhibition of KIAA0368 (Accession XM\_036708). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0368. KIAA1508 (Accession XM\_030209) is another VGAM1764 host target gene. KIAA1508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:30996, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59078] Another function of VGAM1764 is therefore inhibition of

KIAA1508 (Accession XM\_030209). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508. KIAA1535 (Accession XM\_086565) is another VGAM1764 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1535 BINDING SITE, designated SEQ ID:38768, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59079] Another function of VGAM1764 is therefore inhibition of KIAA1535 (Accession XM\_086565). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1535. MFN2 (Accession NM\_014874) is another VGAM1764 host target gene. MFN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MFN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MFN2 BINDING SITE, designated SEQ ID:17012, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59080] Another function of VGAM1764 is therefore inhibition of MFN2 (Accession NM\_014874). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFN2. Nuclear Receptor Subfamily 6, Group A, Member 1 (NR6A1, Accession NM\_001489) is another VGAM1764 host target gene. NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR6A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR6A1 BINDING SITE1 through NR6A1 BINDING SITE3, designated SEQ ID:7230, SEQ ID:27178 and SEQ ID:27184 respectively, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59081] Another function of VGAM1764 is therefore inhibition of Nuclear Receptor Subfamily 6, Group A, Member 1

(NR6A1, Accession NM\_001489). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR6A1. NY-REN-60 (Accession XM\_040506) is another VGAM1764 host target gene. NY-REN-60 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-60, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-60 BINDING SITE, designated SEQ ID:33319, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59082] Another function of VGAM1764 is therefore inhibition of NY-REN-60 (Accession XM\_040506). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-60. Paternally Expressed 10 (PEG10, Accession NM\_015068) is another VGAM1764 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17431, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59083] Another function of VGAM1764 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM\_015068). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255) is another VGAM1764 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22228, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59084] Another function of VGAM1764 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255). Accordingly, utilities of VGAM1764 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. PRO2133 (Accession NM\_018619) is another VGAM1764 host target gene.

PRO2133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2133 BINDING SITE, designated SEQ ID:20691, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59085] Another function of VGAM1764 is therefore inhibition of PRO2133 (Accession NM\_018619). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2133. Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM\_006588) is another VGAM1764 host target gene. SULT1C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of SULT1C2 BINDING SITE, designated SEQ ID:13352, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59086] Another function of VGAM1764 is therefore inhibition of Sulfotransferase Family, Cytosolic, 1C, Member 2 (SULT1C2, Accession NM\_006588). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C2. LOC143879 (Accession XM\_084666) is another VGAM1764 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37661, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59087] Another function of VGAM1764 is therefore inhibition of LOC143879 (Accession XM\_084666). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143879. LOC154007 (Accession XM\_087824) is another VGAM1764 host target gene. LOC154007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39453, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59088] Another function of VGAM1764 is therefore inhibition of LOC154007 (Accession XM\_087824). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. LOC203636 (Accession XM\_114868) is another VGAM1764 host target gene. LOC203636 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203636, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203636 BINDING SITE, designated SEQ ID:43076, to the nucleotide sequence of VGAM1764 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4475.

[59089] Another function of VGAM1764 is therefore inhibition of LOC203636 (Accession XM\_114868). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203636. LOC221477 (Accession XM\_166397) is another VGAM1764 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44252, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59090] Another function of VGAM1764 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC51336 (Accession NM\_016646) is another VGAM1764 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51336, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18756, to the nucleotide sequence of VGAM1764 RNA, herein designated VGAM RNA, also designated SEQ ID:4475.

[59091] Another function of VGAM1764 is therefore inhibition of LOC51336 (Accession NM\_016646). Accordingly, utilities of VGAM1764 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1765 (VGAM1765) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59092] VGAM1765 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1765 was detected is described hereinabove with reference to Figs. 1-8.

[59093] VGAM1765 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Viral Diarrhea

Virus Genotype 2 (BVDV-2). VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59094] VGAM1765 gene encodes a VGAM1765 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1765 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1765 precursor RNA is designated SEQ ID:1751, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1751 is located at position 9624 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2).

[59095] VGAM1765 precursor RNA folds onto itself, forming VGAM1765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59096] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1765 folded precursor RNA into VGAM1765 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1765 RNA is designated SEQ ID:4476, and is provided hereinbelow with reference to the sequence listing part.

[59097] VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1765 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59098] VGAM1765 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1765 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1765 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59099] The complementary binding of VGAM1765 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1765 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1765

host target RNA into VGAM1765 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59100] It is appreciated that VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1765 host target genes. The mRNA of each one of this plurality of VGAM1765 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1765 RNA, herein designated VGAM RNA, and which when bound by VGAM1765 RNA causes inhibition of translation of respective one or more VGAM1765 host target proteins.

[59101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1765 gene, herein designated VGAM GENE, on one or more VGAM1765 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59102] It is yet further appreciated that a function of VGAM1765 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1765 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1765 correlate with, and may be deduced from, the identity of the host target genes which VGAM1765 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59103] Nucleotide sequences of the VGAM1765 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1765 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1765 are further

described hereinbelow with reference to Table 1.

[59104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1765 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1765 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59105] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1765 gene, herein designated VGAM is inhibition of expression of VGAM1765 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1765 correlate with, and may be deduced from, the identity of the target genes which VGAM1765 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59106] Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM\_053056) is a VGAM1765 host target gene. CCND1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CCND1 BINDING SITE, designated SEQ ID:27597, to the nucleotide sequence of VGAM1765 RNA, herein designated VGAM RNA, also designated SEQ ID:4476.

[59107] A function of VGAM1765 is therefore inhibition of Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM\_053056), a gene which is involved in the control of cell cycle and is required for Schwann cell proliferation to proceed normally during Wallerian degeneration. Accordingly, utilities of VGAM1765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND1. The function of CCND1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM220.LOC157280 (Accession XM\_058301) is another VGAM1765 host target gene. LOC157280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157280 BINDING SITE, designated SEQ ID:36591, to the nucleotide sequence of

VGAM1765 RNA, herein designated VGAM RNA, also designated SEQ ID:4476.

[59108] Another function of VGAM1765 is therefore inhibition of LOC157280 (Accession XM\_058301). Accordingly, utilities of VGAM1765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157280. LOC255448 (Accession XM\_170623) is another VGAM1765 host target gene. LOC255448 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255448 BINDING SITE, designated SEQ ID:45401, to the nucleotide sequence of VGAM1765 RNA, herein designated VGAM RNA, also designated SEQ ID:4476.

[59109] Another function of VGAM1765 is therefore inhibition of LOC255448 (Accession XM\_170623). Accordingly, utilities of VGAM1765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255448. LOC92661 (Accession XM\_046465) is another VGAM1765 host target gene. LOC92661 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC92661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34720, to the nucleotide sequence of VGAM1765 RNA, herein designated VGAM RNA, also designated SEQ ID:4476.

[59110] Another function of VGAM1765 is therefore inhibition of LOC92661 (Accession XM\_046465). Accordingly, utilities of VGAM1765 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1766 (VGAM1766) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59111] VGAM1766 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1766 was detected is described hereinabove with reference to Figs. 1-8.

[59112] VGAM1766 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). VGAM1766 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59113] VGAM1766 gene encodes a VGAM1766 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1766 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1766 precursor RNA is designated SEQ ID:1752, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1752 is located at position 5325 relative to the genome of Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2).

[59114] VGAM1766 precursor RNA folds onto itself, forming VGAM1766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[59115] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1766 folded precursor RNA into VGAM1766 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1766 RNA is designated SEQ ID:4477, and is provided hereinbelow with reference to the sequence listing part.

[59116] VGAM1766 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1766 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59117] VGAM1766 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1766 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1766 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1766 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[59118] The complementary binding of VGAM1766 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1766 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1766 host target RNA into VGAM1766 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59119] It is appreciated that VGAM1766 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1766 host target genes. The mRNA of each one of this plurality of VGAM1766 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1766 RNA, herein designated VGAM RNA, and which when bound by VGAM1766 RNA causes inhibition of translation of respective one or more VGAM1766 host target proteins.

[59120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1766 gene, herein designated VGAM GENE, on one or more VGAM1766 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59121] It is yet further appreciated that a function of VGAM1766 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of viral infection by Bovine Viral Diarrhea Virus Genotype 2 (BVDV-2). Specific functions, and accordingly utilities, of VGAM1766 correlate with, and may be deduced from, the identity of the host target genes which VGAM1766 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59122] Nucleotide sequences of the VGAM1766 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1766 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1766 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1766 are further  
described hereinbelow with reference to Table 1.

[59123] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1766 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1766 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[59124] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1766 gene, herein designated VGAM is  
inhibition of expression of VGAM1766 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1766 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1766  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[59125] Serine/arginine Repetitive Matrix 1 (SRRM1, Accession  
NM\_005839) is a VGAM1766 host target gene. SRRM1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRRM1 BINDING SITE, designated SEQ ID:12451, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59126] A function of VGAM1766 is therefore inhibition of Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM\_005839). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRRM1. Serine/threonine Kinase 38 (STK38, Accession NM\_007271) is another VGAM1766 host target gene. STK38 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STK38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38 BINDING SITE, designated SEQ ID:14133, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59127] Another function of VGAM1766 is therefore inhibition of Serine/threonine Kinase 38 (STK38, Accession NM\_007271). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38. Ras Homolog Gene Family, Member U (ARHU, Accession NM\_021205) is another VGAM1766 host target gene. ARHU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHU BINDING SITE, designated SEQ ID:22183, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59128] Another function of VGAM1766 is therefore inhibition of Ras Homolog Gene Family, Member U (ARHU, Accession NM\_021205). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHU. Thioesterase, Adipose Associated (THEA, Accession XM\_038922) is another VGAM1766 host target gene. THEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32951, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59129] Another function of VGAM1766 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM\_038922). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. Zinc Finger Protein 347 (ZNF347, Accession NM\_032584) is another VGAM1766 host target gene. ZNF347 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF347 BINDING SITE, designated SEQ ID:26318, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59130] Another function of VGAM1766 is therefore inhibition of

Zinc Finger Protein 347 (ZNF347, Accession NM\_032584). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF347. LOC131873 (Accession XM\_067585) is another VGAM1766 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37364, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59131] Another function of VGAM1766 is therefore inhibition of LOC131873 (Accession XM\_067585). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. LOC143465 (Accession XM\_096430) is another VGAM1766 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, designated SEQ ID:40359, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59132] Another function of VGAM1766 is therefore inhibition of LOC143465 (Accession XM\_096430). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC158927 (Accession XM\_099004) is another VGAM1766 host target gene. LOC158927 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158927 BINDING SITE, designated SEQ ID:42041, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59133] Another function of VGAM1766 is therefore inhibition of LOC158927 (Accession XM\_099004). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158927. LOC221495 (Accession XM\_168136) is another VGAM1766 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221495 BINDING SITE, designated SEQ ID:45054, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59134] Another function of VGAM1766 is therefore inhibition of LOC221495 (Accession XM\_168136). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC257319 (Accession XM\_171049) is another VGAM1766 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45832, to the nucleotide sequence of VGAM1766 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4477.

[59135] Another function of VGAM1766 is therefore inhibition of LOC257319 (Accession XM\_171049). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. LOC51031 (Accession NM\_016080) is another VGAM1766 host target gene. LOC51031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51031 BINDING SITE, designated SEQ ID:18153, to the nucleotide sequence of VGAM1766 RNA, herein designated VGAM RNA, also designated SEQ ID:4477.

[59136] Another function of VGAM1766 is therefore inhibition of LOC51031 (Accession NM\_016080). Accordingly, utilities of VGAM1766 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51031. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1767 (VGAM1767) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59137] VGAM1767 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1767 was detected is described hereinabove with reference to Figs. 1–8.

[59138] VGAM1767 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59139] VGAM1767 gene encodes a VGAM1767 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1767 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1767 precursor RNA is designated SEQ ID:1753, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1753 is located at position 1407 relative to the genome of Rabbit Fibroma Virus.

[59140] VGAM1767 precursor RNA folds onto itself, forming

VGAM1767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59141] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1767 folded precursor RNA into VGAM1767 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1767 RNA is designated SEQ ID:4478, and is provided hereinbelow with reference to the sequence listing part.

[59142] VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1767 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59143] VGAM1767 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1767 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1767 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59144] The complementary binding of VGAM1767 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1767 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1767 host target RNA into VGAM1767 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59145] It is appreciated that VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1767 host target genes. The mRNA of each one of this plurality of VGAM1767 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1767 RNA, herein designated VGAM RNA, and which when bound by VGAM1767 RNA causes inhibition of translation of respective one or more VGAM1767 host target proteins.

[59146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1767 gene, herein designated VGAM GENE, on one or more VGAM1767 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59147] It is yet further appreciated that a function of VGAM1767 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1767 correlate with, and may be deduced from, the identity of the host target genes which VGAM1767 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[59148] Nucleotide sequences of the VGAM1767 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1767 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1767 are further described hereinbelow with reference to Table 1.

[59149] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1767 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1767 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59150] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1767 gene, herein designated VGAM is inhibition of expression of VGAM1767 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1767 correlate with, and may be deduced from, the identity of the target genes which VGAM1767 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[59151] Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM\_000492) is a VGAM1767 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CFTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:6102, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59152] A function of VGAM1767 is therefore inhibition of Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM\_000492). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440) is another VGAM1767 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7167, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59153] Another function of VGAM1767 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440), a gene which is a member of the multiple exostoses gene family. Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM\_006496) is another VGAM1767 host target gene. GNAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI3 BINDING SITE, designated SEQ

ID:13241, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59154] Another function of VGAM1767 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM\_006496), a gene which stimulates receptor regulated K<sup>+</sup>-channels. Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI3. The function of GNAI3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM45. Formin Binding Protein 3 (FNBP3, Accession XM\_087118) is another VGAM1767 host target gene. FNBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FNBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FNBP3 BINDING SITE, designated SEQ ID:39074, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ

ID:4478.

[59155] Another function of VGAM1767 is therefore inhibition of Formin Binding Protein 3 (FNBP3, Accession XM\_087118). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNBP3. KIAA0781 (Accession XM\_041314) is another VGAM1767 host target gene. KIAA0781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0781 BINDING SITE, designated SEQ ID:33501, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59156] Another function of VGAM1767 is therefore inhibition of KIAA0781 (Accession XM\_041314). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0781. KIAA1715 (Accession XM\_042834) is another VGAM1767 host target gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:33793, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59157] Another function of VGAM1767 is therefore inhibition of KIAA1715 (Accession XM\_042834). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. PIP3-E (Accession XM\_039749) is another VGAM1767 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33179, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59158] Another function of VGAM1767 is therefore inhibition of PIP3-E (Accession XM\_039749). Accordingly, utilities of

VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Splicing Factor, Arginine/serine-rich 5 (SFRS5, Accession NM\_006925) is another VGAM1767 host target gene.

SFRS5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SFRS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS5 BINDING SITE, designated SEQ ID:13805, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59159] Another function of VGAM1767 is therefore inhibition of Splicing Factor, Arginine/serine-rich 5 (SFRS5, Accession NM\_006925). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS5. LOC160414 (Accession XM\_100898) is another VGAM1767 host target gene. LOC160414 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC160414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC160414 BINDING SITE, designated SEQ ID:42104, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59160] Another function of VGAM1767 is therefore inhibition of LOC160414 (Accession XM\_100898). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160414. LOC170217 (Accession XM\_093185) is another VGAM1767 host target gene. LOC170217 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170217 BINDING SITE, designated SEQ ID:40179, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59161] Another function of VGAM1767 is therefore inhibition of LOC170217 (Accession XM\_093185). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170217. LOC170218 (Accession XM\_093186) is an-

other VGAM1767 host target gene. LOC170218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170218 BINDING SITE, designated SEQ ID:40181, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59162] Another function of VGAM1767 is therefore inhibition of LOC170218 (Accession XM\_093186). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170218. LOC206887 (Accession XM\_116781) is another VGAM1767 host target gene. LOC206887 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC206887, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206887 BINDING SITE, designated SEQ ID:43125, to the nucleotide sequence of VGAM1767 RNA, herein designated VGAM RNA, also designated SEQ ID:4478.

[59163] Another function of VGAM1767 is therefore inhibition of LOC206887 (Accession XM\_116781). Accordingly, utilities of VGAM1767 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206887. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1768 (VGAM1768) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59164] VGAM1768 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1768 was detected is described hereinabove with reference to Figs. 1–8.

[59165] VGAM1768 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59166] VGAM1768 gene encodes a VGAM1768 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1768 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1768 precursor RNA is designated SEQ ID:1754, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1754 is located at position 431 relative to the genome of Rabbit Fibroma Virus.

[59167] VGAM1768 precursor RNA folds onto itself, forming VGAM1768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59168] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1768 folded precursor RNA into VGAM1768 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1768 RNA is designated SEQ ID:4479, and is provided hereinbelow with reference to the sequence listing part.

[59169] VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1768 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59170] VGAM1768 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1768 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1768 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59171] The complementary binding of VGAM1768 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1768 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1768 host target RNA into VGAM1768 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59172] It is appreciated that VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1768 host target genes. The mRNA of each one of this plurality of VGAM1768 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1768 RNA, herein designated VGAM RNA, and which when bound by VGAM1768 RNA causes inhibition of translation of respective one or more VGAM1768 host target proteins.

[59173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1768 gene, herein designated VGAM GENE, on one or more VGAM1768 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59174] It is yet further appreciated that a function of VGAM1768 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1768 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1768 correlate with, and may be deduced from, the identity of the host target genes which VGAM1768 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59175] Nucleotide sequences of the VGAM1768 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1768 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1768 are further described hereinbelow with reference to Table 1.

[59176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1768 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1768 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[59177] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1768 gene, herein designated VGAM is inhibition of expression of VGAM1768 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1768 correlate with, and may be deduced from, the identity of the target genes which VGAM1768 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59178] LOC93538 (Accession XM\_051927) is a VGAM1768 host target gene. LOC93538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93538 BINDING SITE, designated SEQ ID:35921, to the nucleotide sequence of VGAM1768 RNA, herein designated VGAM RNA, also designated SEQ ID:4479.

[59179] A function of VGAM1768 is therefore inhibition of LOC93538 (Accession XM\_051927). Accordingly, utilities of VGAM1768 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1769 (VGAM1769) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59180] VGAM1769 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1769 was detected is described hereinabove with reference to Figs. 1–8.

[59181] VGAM1769 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59182] VGAM1769 gene encodes a VGAM1769 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1769 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1769 precursor RNA is designated SEQ ID:1755, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1755 is located at position 123 relative to the genome of Rabbit Fibroma Virus.

- [59183] VGAM1769 precursor RNA folds onto itself, forming VGAM1769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [59184] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1769 folded precursor RNA into VGAM1769 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1769 RNA is designated SEQ ID:4480, and is provided hereinbelow with reference to the sequence listing part.

[59185] VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1769 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59186] VGAM1769 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1769 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1769 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[59187] The complementary binding of VGAM1769 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1769 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1769 host target RNA into VGAM1769 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59188] It is appreciated that VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1769 host target genes. The mRNA of each one of this plurality of VGAM1769 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1769 RNA, herein designated VGAM RNA, and which when bound by VGAM1769 RNA causes

inhibition of translation of respective one or more VGAM1769 host target proteins.

[59189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1769 gene, herein designated VGAM GENE, on one or more VGAM1769 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59190] It is yet further appreciated that a function of VGAM1769 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1769 include diagnosis, prevention and

treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1769 correlate with, and may be deduced from, the identity of the host target genes which VGAM1769 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59191] Nucleotide sequences of the VGAM1769 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1769 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1769 are further described hereinbelow with reference to Table 1.

[59192] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1769 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1769 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59193] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1769 gene, herein designated VGAM is inhibition of expression of VGAM1769 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1769 correlate with, and may be deduced from, the identity of the target genes which VGAM1769 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59194] Collagen, Type IV, Alpha 5 (Alport syndrome) (COL4A5, Accession NM\_000495) is a VGAM1769 host target gene. COL4A5 BINDING SITE1 through COL4A5 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A5 BINDING SITE1 through COL4A5 BINDING SITE3, designated SEQ ID:6110, SEQ ID:27213 and SEQ ID:27216 respectively, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59195] A function of VGAM1769 is therefore inhibition of Collagen, Type IV, Alpha 5 (Alport syndrome) (COL4A5, Accession NM\_000495). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A5. SIP (Accession

NM\_014412) is another VGAM1769 host target gene. SIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIP BINDING SITE, designated SEQ ID:15758, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59196] Another function of VGAM1769 is therefore inhibition of SIP (Accession NM\_014412). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIP. Cadherin-like 26 (CDH26, Accession NM\_021810) is another VGAM1769 host target gene. CDH26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH26 BINDING SITE, designated SEQ ID:22372, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59197] Another function of VGAM1769 is therefore inhibition of Cadherin-like 26 (CDH26, Accession NM\_021810). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH26. FLJ12604 (Accession XM\_035022) is another VGAM1769 host target gene. FLJ12604 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12604, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12604 BINDING SITE, designated SEQ ID:32193, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59198] Another function of VGAM1769 is therefore inhibition of FLJ12604 (Accession XM\_035022). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12604. Hypermethylated In Cancer 2 (HIC2, Accession XM\_036937) is another VGAM1769 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32534, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59199] Another function of VGAM1769 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM\_036937). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. KIAA1255 (Accession XM\_040626) is another VGAM1769 host target gene. KIAA1255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1255 BINDING SITE, designated SEQ ID:33348, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59200] Another function of VGAM1769 is therefore inhibition of KIAA1255 (Accession XM\_040626). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1255. MGC11257 (Accession NM\_032350) is another VGAM1769 host target gene. MGC11257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11257 BINDING SITE, designated SEQ ID:26140, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59201] Another function of VGAM1769 is therefore inhibition of MGC11257 (Accession NM\_032350). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11257. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550) is another VGAM1769 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ

ID:17818, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59202] Another function of VGAM1769 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. LOC113763 (Accession NM\_138434) is another VGAM1769 host target gene. LOC113763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:28806, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59203] Another function of VGAM1769 is therefore inhibition of LOC113763 (Accession NM\_138434). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113763. LOC130595 (Accession XM\_065793) is an-

other VGAM1769 host target gene. LOC130595 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130595 BINDING SITE, designated SEQ ID:37300, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59204] Another function of VGAM1769 is therefore inhibition of LOC130595 (Accession XM\_065793). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130595. LOC199796 (Accession XM\_058994) is another VGAM1769 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36809, to the nucleotide sequence of VGAM1769 RNA, herein designated VGAM RNA, also designated SEQ ID:4480.

[59205] Another function of VGAM1769 is therefore inhibition of LOC199796 (Accession XM\_058994). Accordingly, utilities of VGAM1769 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1770 (VGAM1770) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59206] VGAM1770 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1770 was detected is described hereinabove with reference to Figs. 1–8.

[59207] VGAM1770 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59208] VGAM1770 gene encodes a VGAM1770 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1770 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1770 precursor RNA is designated SEQ ID:1756, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1756 is located at position 8292 relative to the genome of Rabbit Fibroma Virus.

- [59209] VGAM1770 precursor RNA folds onto itself, forming VGAM1770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [59210] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1770 folded precursor RNA into VGAM1770 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1770 RNA is designated SEQ ID:4481, and is provided hereinbelow with reference to the sequence listing part.

[59211] VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1770 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59212] VGAM1770 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1770 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1770 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59213] The complementary binding of VGAM1770 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1770 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1770 host target RNA into VGAM1770 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59214] It is appreciated that VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1770 host target genes. The mRNA of each one of this plurality of VGAM1770 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1770 RNA, herein designated VGAM RNA, and which when bound by VGAM1770 RNA causes inhibition of translation of respective one or more VGAM1770 host target proteins.

[59215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1770 gene, herein designated VGAM GENE, on one or more VGAM1770 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59216] It is yet further appreciated that a function of VGAM1770 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1770 correlate with, and may be deduced from, the identity of the host target genes which VGAM1770 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59217] Nucleotide sequences of the VGAM1770 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1770 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1770 are further described hereinbelow with reference to Table 1.

[59218] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1770 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1770 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[59219] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1770 gene, herein designated VGAM is inhibition of expression of VGAM1770 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1770 correlate with, and may be deduced from, the identity of the target genes which VGAM1770 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59220] Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_138271) is a VGAM1770 host target gene. ATRX BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRX BINDING SITE, designated SEQ ID:28682, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59221] A function of VGAM1770 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession

NM\_138271). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM\_020131) is another VGAM1770 host target gene. C1orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf6 BINDING SITE, designated SEQ ID:21330, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59222] Another function of VGAM1770 is therefore inhibition of Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM\_020131), a gene which may link ataxin-1 with the chaperone and ubiquitin/proteasome pathways. Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf6. The function of C1orf6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1286. Fibulin 1 (FBLN1,

Accession NM\_006485) is another VGAM1770 host target gene. FBLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN1 BINDING SITE, designated SEQ ID:13213, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59223] Another function of VGAM1770 is therefore inhibition of Fibulin 1 (FBLN1, Accession NM\_006485), a gene which secreted glycoprotein; has EGF-like repeats, similar to anaphylatoxins C3a, C4a, and C5a. Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN1. The function of FBLN1 has been established by previous studies. Fibulin-1 was first described as an integrin-binding fibulin from human placenta by Argraves et al. (1989), who found that it is a secreted glycoprotein that becomes incorporated into a fibrillar extracellular matrix when expressed in cultured cells or added exogenously to cell monolayers. Preliminary electron micro-

scopic data suggested a rod-like structure for fibulin-1, consistent with the sequence predictions. Calcium-binding to fibulin-1 is apparently required to mediate its binding to laminin and nidogen (OMIM Ref. No. 131390). By in situ hybridization of tritium-labeled cDNA probes, Mattei et al. (1994) assigned the human FBLN1 gene to 22q13.2-q13.3 and assigned its counterpart in mouse to the E-F band of chromosome 15. Korenberg et al. (1995) assigned the FBLN1 gene to 22q13.3 by fluorescence in situ hybridization.

[59224] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59225] Korenberg, J. R.; Chen, X.-N.; Tran, H.; Argraves, W. S. : Localization of the human gene for fibulin-1 (FBLN1) to chromosome band 22q13.3. *Cytogenet. Cell Genet.* 68: 192-193, 1995. ; and

[59226] Mattei, M.-G.; Pan, T.-C.; Zhang, R.-Z.; Timpl, R.; Chu, M.-L. : The fibulin-1 gene (FBLN1) is located on human chromosome 22 and on mouse chromosome 15. *Genomics* 22: 437-438, 1994.

[59227] Further studies establishing the function and utilities of FBLN1 are found in John Hopkins OMIM database record

ID 135820, and in cited publications numbered 3464–3466 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM\_002235) is another VGAM1770 host target gene. KCNA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA6 BINDING SITE, designated SEQ ID:8020, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59228] Another function of VGAM1770 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 6 (KCNA6, Accession NM\_002235), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA6. The function of KCNA6 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM893. Sodium Channel, Nonvoltage-gated 1, Gamma (SCNN1G, Accession NM\_001039) is another VGAM1770 host target gene. SCNN1G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCNN1G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCNN1G BINDING SITE, designated SEQ ID:6705, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59229] Another function of VGAM1770 is therefore inhibition of Sodium Channel, Nonvoltage-gated 1, Gamma (SCNN1G, Accession NM\_001039). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCNN1G. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331) is another VGAM1770 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23637, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59230] Another function of VGAM1770 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM\_168403) is another VGAM1770 host target gene. FKBP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:45143, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59231] Another function of VGAM1770 is therefore inhibition of FK506 Binding Protein 9, 63 KDa (FKBP9, Accession

XM\_168403). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP9. FLJ10661 (Accession NM\_018172) is another VGAM1770 host target gene.

FLJ10661 BINDING SITE1 and FLJ10661 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10661, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10661 BINDING SITE1 and FLJ10661 BINDING SITE2, designated SEQ ID:19998 and SEQ ID:19999 respectively, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59232] Another function of VGAM1770 is therefore inhibition of FLJ10661 (Accession NM\_018172). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10661. ICK (Accession NM\_016513) is another VGAM1770 host target gene. ICK BINDING SITE1 and ICK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ICK, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE1 and ICK BINDING SITE2, designated SEQ ID:18593 and SEQ ID:17193 respectively, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59233] Another function of VGAM1770 is therefore inhibition of ICK (Accession NM\_016513). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. KIAA0892 (Accession XM\_048457) is another VGAM1770 host target gene. KIAA0892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0892 BINDING SITE, designated SEQ ID:35173, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59234] Another function of VGAM1770 is therefore inhibition of KIAA0892 (Accession XM\_048457). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0892. Lipoma HMGIC Fusion Partner (LHFP, Accession NM\_005780) is another VGAM1770 host target gene. LHFP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LHFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFP BINDING SITE, designated SEQ ID:12357, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59235] Another function of VGAM1770 is therefore inhibition of Lipoma HMGIC Fusion Partner (LHFP, Accession NM\_005780). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFP. MAC30 (Accession XM\_031536) is another VGAM1770 host target gene. MAC30 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAC30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAC30 BINDING SITE, designated SEQ

ID:31401, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59236] Another function of VGAM1770 is therefore inhibition of MAC30 (Accession XM\_031536). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAC30. Purinergic Receptor P2X, Ligand-gated Ion Channel, 5 (P2RX5, Accession NM\_002561) is another VGAM1770 host target gene. P2RX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RX5 BINDING SITE, designated SEQ ID:8409, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59237] Another function of VGAM1770 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 5 (P2RX5, Accession NM\_002561). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX5.

LOC149577 (Accession XM\_097675) is another VGAM1770 host target gene. LOC149577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149577 BINDING SITE, designated SEQ ID:41026, to the nucleotide sequence of VGAM1770 RNA, herein designated VGAM RNA, also designated SEQ ID:4481.

[59238] Another function of VGAM1770 is therefore inhibition of LOC149577 (Accession XM\_097675). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149577. LOC153196 (Accession XM\_098323) is another VGAM1770 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41594, to the nucleotide sequence of VGAM1770 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4481.

[59239] Another function of VGAM1770 is therefore inhibition of LOC153196 (Accession XM\_098323). Accordingly, utilities of VGAM1770 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1771 (VGAM1771) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59240] VGAM1771 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1771 was detected is described hereinabove with reference to Figs. 1–8.

[59241] VGAM1771 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Type 1. VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59242] VGAM1771 gene encodes a VGAM1771 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1771 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1771 precursor RNA is designated SEQ ID:1757, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1757 is located at position 3477 relative to the genome of Pestivirus Type 1.

[59243] VGAM1771 precursor RNA folds onto itself, forming VGAM1771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59244] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1771 folded precursor RNA into VGAM1771 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1771 RNA is designated SEQ ID:4482, and is provided hereinbelow with reference to the sequence listing part.

[59245] VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1771 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59246] VGAM1771 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1771 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1771 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[59247] The complementary binding of VGAM1771 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1771 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1771 host target RNA into VGAM1771 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59248] It is appreciated that VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1771 host target genes. The mRNA of

each one of this plurality of VGAM1771 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1771 RNA, herein designated VGAM RNA, and which when bound by VGAM1771 RNA causes inhibition of translation of respective one or more VGAM1771 host target proteins.

[59249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1771 gene, herein designated VGAM GENE, on one or more VGAM1771 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[59250] It is yet further appreciated that a function of VGAM1771 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of viral infection by Pestivirus Type 1. Specific functions, and accordingly utilities, of VGAM1771 correlate with, and may be deduced from, the identity of the host target genes which VGAM1771 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59251] Nucleotide sequences of the VGAM1771 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1771 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1771 are further described hereinbelow with reference to Table 1.

[59252] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1771 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1771 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59253] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1771 gene, herein designated VGAM is inhibition of expression of VGAM1771 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1771 correlate with, and may be deduced from, the identity of the target genes which VGAM1771 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59254] Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134) is a VGAM1771 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5622, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59255] A function of VGAM1771 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134), a gene which may have a role in dietary fat

uptake or processing. Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951. Leucine Zipper Protein 1 (LUZP1, Accession NM\_033631) is another VGAM1771 host target gene. LUZP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LUZP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LUZP1 BINDING SITE, designated SEQ ID:27354, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59256] Another function of VGAM1771 is therefore inhibition of Leucine Zipper Protein 1 (LUZP1, Accession NM\_033631). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LUZP1. Sine Oculis Homeobox Homolog 2 (Drosophila) (SIX2, Accession NM\_016932) is an-

other VGAM1771 host target gene. SIX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIX2 BINDING SITE, designated SEQ ID:18849, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59257] Another function of VGAM1771 is therefore inhibition of Sine Oculis Homeobox Homolog 2 (Drosophila) (SIX2, Accession NM\_016932), a gene which may be involved in limb tendon and ligament development (by similarity). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIX2. The function of SIX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM\_003473) is another VGAM1771 host target gene. STAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

STAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM BINDING SITE, designated SEQ ID:9541, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59258] Another function of VGAM1771 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM\_003473), a gene which is as an adaptor molecule involved in the downstream signaling of cytokine receptors. Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM. The function of STAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM927.FLJ10724 (Accession NM\_018194) is another VGAM1771 host target gene. FLJ10724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10724 BINDING SITE, designated SEQ ID:20053, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59259] Another function of VGAM1771 is therefore inhibition of FLJ10724 (Accession NM\_018194). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10724. FLJ13072 (Accession XM\_117117) is another VGAM1771 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43232, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59260] Another function of VGAM1771 is therefore inhibition of FLJ13072 (Accession XM\_117117). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. GENX-3414 (Accession NM\_003943) is another VGAM1771 host target gene. GENX-3414 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GENX-3414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GENX-3414 BINDING SITE, designated SEQ ID:10058, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59261] Another function of VGAM1771 is therefore inhibition of GENX-3414 (Accession NM\_003943). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GENX-3414. KIAA0430 (Accession NM\_019081) is another VGAM1771 host target gene. KIAA0430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0430 BINDING SITE, designated SEQ ID:21150, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59262] Another function of VGAM1771 is therefore inhibition of

KIAA0430 (Accession NM\_019081). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0430. KIAA0992 (Accession NM\_016081) is another VGAM1771 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:18157, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59263] Another function of VGAM1771 is therefore inhibition of KIAA0992 (Accession NM\_016081). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1466 (Accession XM\_050285) is another VGAM1771 host target gene. KIAA1466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1466 BINDING SITE, designated SEQ ID:35601, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59264] Another function of VGAM1771 is therefore inhibition of KIAA1466 (Accession XM\_050285). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1466. KIAA1500 (Accession XM\_034353) is another VGAM1771 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32069, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59265] Another function of VGAM1771 is therefore inhibition of KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. KIAA1613 (Accession XM\_035946) is another

VGAM1771 host target gene. KIAA1613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1613 BINDING SITE, designated SEQ ID:32360, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59266] Another function of VGAM1771 is therefore inhibition of KIAA1613 (Accession XM\_035946). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1613. KIAA1977 (Accession XM\_058800) is another VGAM1771 host target gene. KIAA1977 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1977 BINDING SITE, designated SEQ ID:36747, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59267] Another function of VGAM1771 is therefore inhibition of KIAA1977 (Accession XM\_058800). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1977. LAK-4P (Accession NM\_007267) is another VGAM1771 host target gene. LAK-4P BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAK-4P, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAK-4P BINDING SITE, designated SEQ ID:14131, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59268] Another function of VGAM1771 is therefore inhibition of LAK-4P (Accession NM\_007267). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAK-4P. MGC35558 (Accession NM\_145013) is another VGAM1771 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29612, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59269] Another function of VGAM1771 is therefore inhibition of MGC35558 (Accession NM\_145013). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. Makorin, Ring Finger Protein, 1 (MKRN1, Accession NM\_013446) is another VGAM1771 host target gene. MKRN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKRN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN1 BINDING SITE, designated SEQ ID:15112, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59270] Another function of VGAM1771 is therefore inhibition of Makorin, Ring Finger Protein, 1 (MKRN1, Accession NM\_013446). Accordingly, utilities of VGAM1771 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN1. Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM\_007229) is another VGAM1771 host target gene. PACSIN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN2 BINDING SITE, designated SEQ ID:14095, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59271] Another function of VGAM1771 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM\_007229). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN2. RRP4 (Accession NM\_014285) is another VGAM1771 host target gene. RRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRP4 BINDING SITE, designated SEQ ID:15560, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59272] Another function of VGAM1771 is therefore inhibition of RRP4 (Accession NM\_014285). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRP4. SIMRP7 (Accession XM\_166462) is another VGAM1771 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44368, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59273] Another function of VGAM1771 is therefore inhibition of SIMRP7 (Accession XM\_166462). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7.

LOC145783 (Accession XM\_085231) is another VGAM1771 host target gene. LOC145783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145783 BINDING SITE, designated SEQ ID:37976, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59274] Another function of VGAM1771 is therefore inhibition of LOC145783 (Accession XM\_085231). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145783. LOC220514 (Accession XM\_017498) is another VGAM1771 host target gene. LOC220514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220514 BINDING SITE, designated SEQ ID:30320, to the nucleotide sequence of VGAM1771 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4482.

[59275] Another function of VGAM1771 is therefore inhibition of LOC220514 (Accession XM\_017498). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220514. LOC220930 (Accession XM\_167624) is another VGAM1771 host target gene. LOC220930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220930 BINDING SITE, designated SEQ ID:44732, to the nucleotide sequence of VGAM1771 RNA, herein designated VGAM RNA, also designated SEQ ID:4482.

[59276] Another function of VGAM1771 is therefore inhibition of LOC220930 (Accession XM\_167624). Accordingly, utilities of VGAM1771 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220930. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1772 (VGAM1772) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59277] VGAM1772 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1772 was detected is described hereinabove with reference to Figs. 1–8.

[59278] VGAM1772 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pestivirus Type 1. VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59279] VGAM1772 gene encodes a VGAM1772 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1772 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1772 precursor RNA is designated SEQ ID:1758, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1758 is located at position 2037 relative to the genome of Pestivirus Type 1.

[59280] VGAM1772 precursor RNA folds onto itself, forming

VGAM1772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59281] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1772 folded precursor RNA into VGAM1772 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1772 RNA is designated SEQ ID:4483, and is provided hereinbelow with reference to the sequence listing part.

[59282] VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1772 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59283] VGAM1772 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1772 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1772 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59284] The complementary binding of VGAM1772 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1772 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1772 host target RNA into VGAM1772 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59285] It is appreciated that VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1772 host target genes. The mRNA of each one of this plurality of VGAM1772 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1772 RNA, herein designated VGAM RNA, and which when bound by VGAM1772 RNA causes inhibition of translation of respective one or more VGAM1772 host target proteins.

[59286] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1772 gene, herein designated VGAM GENE, on one or more VGAM1772 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59287] It is yet further appreciated that a function of VGAM1772 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1772 include diagnosis, prevention and treatment of viral infection by Pestivirus Type 1. Specific functions, and accordingly utilities, of VGAM1772 correlate with, and may be deduced from, the identity of the host target genes which VGAM1772 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[59288] Nucleotide sequences of the VGAM1772 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1772 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1772 are further described hereinbelow with reference to Table 1.

[59289] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1772 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1772 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59290] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1772 gene, herein designated VGAM is inhibition of expression of VGAM1772 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1772 correlate with, and may be deduced from, the identity of the target genes which VGAM1772 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[59291] MHC Class II Transactivator (MHC2TA, Accession NM\_000246) is a VGAM1772 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5775, to the nucleotide sequence of VGAM1772 RNA, herein designated VGAM RNA, also designated SEQ ID:4483.

[59292] A function of VGAM1772 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM\_000246). Accordingly, utilities of VGAM1772 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM\_019555) is another VGAM1772 host target gene. ARHGEF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF3 BINDING SITE, designated SEQ ID:21208, to the nucleotide sequence of VGAM1772 RNA, herein designated VGAM RNA, also designated SEQ ID:4483.

[59293] Another function of VGAM1772 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM\_019555). Accordingly, utilities of VGAM1772 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF3. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM\_006379) is another VGAM1772 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:13071, to the nucleotide sequence of VGAM1772 RNA, herein designated VGAM RNA, also designated SEQ ID:4483.

[59294] Another function of VGAM1772 is therefore inhibition of

Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM\_006379). Accordingly, utilities of VGAM1772 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1773 (VGAM1773) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59295] VGAM1773 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1773 was detected is described hereinabove with reference to Figs. 1–8.

[59296] VGAM1773 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59297] VGAM1773 gene encodes a VGAM1773 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1773 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1773 precursor RNA is designated SEQ ID:1759, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1759 is located at position 6368 relative to the genome of Cryphonectria Hypovirus 1.

[59298] VGAM1773 precursor RNA folds onto itself, forming VGAM1773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59299] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1773 folded precursor RNA into VGAM1773 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1773 RNA is designated SEQ ID:4484, and is provided hereinbelow with reference to the sequence listing part.

[59300] VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1773 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[59301] VGAM1773 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1773 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1773 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59302] The complementary binding of VGAM1773 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1773 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1773 host target RNA into VGAM1773 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59303] It is appreciated that VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1773 host target genes. The mRNA of each one of this plurality of VGAM1773 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1773 RNA, herein designated VGAM RNA, and which when bound by VGAM1773 RNA causes inhibition of translation of respective one or more VGAM1773 host target proteins.

[59304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1773 gene, herein designated VGAM GENE, on one or more VGAM1773 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59305] It is yet further appreciated that a function of VGAM1773 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1773 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1773 correlate with, and may be deduced from, the identity of the host target genes which VGAM1773 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59306] Nucleotide sequences of the VGAM1773 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1773 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1773 are further described hereinbelow with reference to Table 1.

[59307] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1773 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1773 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[59308] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1773 gene, herein designated VGAM is inhibition of expression of VGAM1773 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1773 correlate with, and may be deduced from, the identity of the target genes which VGAM1773 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59309] Paired Box Gene 4 (PAX4, Accession NM\_006193) is a VGAM1773 host target gene. PAX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX4 BINDING SITE, designated SEQ ID:12865, to the nucleotide sequence of VGAM1773 RNA, herein designated VGAM RNA, also designated SEQ ID:4484.

[59310] A function of VGAM1773 is therefore inhibition of Paired Box Gene 4 (PAX4, Accession NM\_006193), a gene which involves in the differentiation of endoderm-derived endocrine pancreas. Accordingly, utilities of VGAM1773 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX4. The function of PAX4 has been established by previous studies. Bonthron et al. (1998) described the partial structure of PAX4, including the entire coding region. They found that the gene has 10 exons, with the paired domain and homeodomain contained in 6 exons, which they named B to G. By searching sequence databases with a mouse Pax4 cDNA, Matsushita et al. (1998) and Inoue et al. (1998) identified a human cosmid clone that maps to chromosome 7q31.3 and contains the human PAX4 sequence. The human PAX4 gene encodes a deduced 350-amino acid protein that is 80% identical to the deduced mouse Pax4 protein. RT-PCR detected mouse Pax4 expression in pancreatic islets and islet beta cell lines, but not in the other 13 adult mouse organs examined (Matsushita et al., 1998). Pilz et al. (1993) used mouse Pax4 cDNAs as probes to map the human homolog to chromosome 7 in somatic cell hybrids. By use of hybrids carrying translocated chromosomes, they showed that the human PAX4 gene is located on 7q22-qter. Animal model experiments lend further support to the function of PAX4. Sosa-Pineda et al. (1997) showed by study of knockout mice that the Pax4 gene is

essential for differentiation of insulin-producing beta-cells in mammalian pancreas. See also PAX6 (OMIM Ref. No. 607108) and St-Onge et al. (1997), who concluded that both PAX4 and PAX6 genes are required for endocrine fate in the pancreas.

[59311] It is appreciated that the abovementioned animal model for PAX4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[59312] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59313] Matsushita, T.; Yamaoka, T.; Otsuka, S.; Moritani, M.; Matsumoto, T.; Itakura, M. : Molecular cloning of mouse paired-box-containing gene (Pax)-4 from an islet beta cell line and deduced sequence of human Pax-4. Biochem. Biophys. Res. Commun. 242: 176-180, 1998. ; and

[59314] Sosa-Pineda, B.; Chowdhury, K.; Torres, M.; Oliver, G.; Gruss, P. : The Pax4 gene is essential for differentiation of insulin-producing beta cells in the mammalian pancreas. Nature 386:.

[59315] Further studies establishing the function and utilities of PAX4 are found in John Hopkins OMIM database record ID

167413, and in cited publications numbered 10758–10761, 10338, 10762–10763, 1071 and 10764 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP-binding Cassette, Sub-family A (ABC1), Member 5 (ABCA5, Accession NM\_018672) is another VGAM1773 host target gene. ABCA5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA5 BINDING SITE, designated SEQ ID:20746, to the nucleotide sequence of VGAM1773 RNA, herein designated VGAM RNA, also designated SEQ ID:4484.

[59316] Another function of VGAM1773 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 5 (ABCA5, Accession NM\_018672). Accordingly, utilities of VGAM1773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA5. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM\_002816) is another VGAM1773 host target gene. PSMD12 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD12 BINDING SITE, designated SEQ ID:8680, to the nucleotide sequence of VGAM1773 RNA, herein designated VGAM RNA, also designated SEQ ID:4484.

[59317] Another function of VGAM1773 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM\_002816). Accordingly, utilities of VGAM1773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD12. TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 150kDa (TAF2, Accession NM\_003184) is another VGAM1773 host target gene. TAF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF2 BINDING SITE, designated SEQ ID:9161, to the nucleotide sequence of VGAM1773 RNA, herein

designated VGAM RNA, also designated SEQ ID:4484.

[59318] Another function of VGAM1773 is therefore inhibition of TAF2 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 150kDa (TAF2, Accession NM\_003184). Accordingly, utilities of VGAM1773 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1774 (VGAM1774) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59319] VGAM1774 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1774 was detected is described hereinabove with reference to Figs. 1–8.

[59320] VGAM1774 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59321] VGAM1774 gene encodes a VGAM1774 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1774 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1774 precursor RNA is designated SEQ ID:1760, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1760 is located at position 10666 relative to the genome of Cryphonectria Hypovirus 1.

[59322] VGAM1774 precursor RNA folds onto itself, forming VGAM1774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59323] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1774 folded precursor RNA into VGAM1774 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1774 RNA is designated SEQ ID:4485, and is provided hereinbelow with reference to the sequence listing part.

[59324] VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1774 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59325] VGAM1774 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1774 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1774 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59326] The complementary binding of VGAM1774 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1774 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1774 host target RNA into VGAM1774 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59327] It is appreciated that VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1774 host target genes. The mRNA of each one of this plurality of VGAM1774 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1774 RNA, herein designated VGAM RNA, and which when bound by VGAM1774 RNA causes inhibition of translation of respective one or more VGAM1774 host target proteins.

[59328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1774 gene, herein designated VGAM GENE, on one or more VGAM1774 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[59329] It is yet further appreciated that a function of VGAM1774 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1774 correlate with, and may be deduced from, the identity of the host target genes which VGAM1774 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59330] Nucleotide sequences of the VGAM1774 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1774 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1774 are further described hereinbelow with reference to Table 1.

[59331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1774 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1774 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59332] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1774 gene, herein designated VGAM is inhibition of expression of VGAM1774 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1774 correlate with, and may be deduced from, the identity of the target genes which VGAM1774 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59333] Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM\_004529) is a VGAM1774 host target gene. MLLT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT3 BINDING SITE, designated SEQ ID:10867, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59334] A function of VGAM1774 is therefore inhibition of

Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM\_004529), a gene which is Serine and proline rich protein. Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT3. The function of MLLT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM67. Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM\_056815) is another VGAM1774 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36425, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59335] Another function of VGAM1774 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase

E3 dunce homolog, Drosophila) (PDE4D, Accession XM\_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Parathyroid Hormone-like Hormone (PTH LH, Accession NM\_002820) is another VGAM1774 host target gene. PTH LH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTH LH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTH LH BINDING SITE, designated SEQ ID:8685, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59336] Another function of VGAM1774 is therefore inhibition of Parathyroid Hormone-like Hormone (PTH LH, Accession NM\_002820), a gene which plays a physiological role in

lactation, possibly as a hormone for the mobilization and/or transfer of calcium to the milk. Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTHLH. The function of PTHLH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1590. Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM\_019555) is another VGAM1774 host target gene. ARHGEF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF3 BINDING SITE, designated SEQ ID:21210, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59337] Another function of VGAM1774 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 3 (ARHGEF3, Accession NM\_019555). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

ARHGEF3. DKFZP434I0714 (Accession XM\_098247) is another VGAM1774 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I0714 BINDING SITE, designated SEQ ID:41528, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59338] Another function of VGAM1774 is therefore inhibition of DKFZP434I0714 (Accession XM\_098247). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I0714. DKFZP586F1524 (Accession NM\_015584) is another VGAM1774 host target gene. DKFZP586F1524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586F1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586F1524 BINDING SITE,

designated SEQ ID:17851, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59339] Another function of VGAM1774 is therefore inhibition of DKFZP586F1524 (Accession NM\_015584). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1524. FLJ10815 (Accession NM\_018231) is another VGAM1774 host target gene. FLJ10815 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10815 BINDING SITE, designated SEQ ID:20173, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59340] Another function of VGAM1774 is therefore inhibition of FLJ10815 (Accession NM\_018231). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10815. FLJ22415 (Accession XM\_166168) is another VGAM1774 host target gene. FLJ22415 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22415 BINDING SITE, designated SEQ ID:43983, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59341] Another function of VGAM1774 is therefore inhibition of FLJ22415 (Accession XM\_166168). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22415. KIAA0820 (Accession XM\_044463) is another VGAM1774 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34214, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59342] Another function of VGAM1774 is therefore inhibition of

KIAA0820 (Accession XM\_044463). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA1863 (Accession XM\_036104) is another VGAM1774 host target gene. KIAA1863 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1863 BINDING SITE, designated SEQ ID:32379, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59343] Another function of VGAM1774 is therefore inhibition of KIAA1863 (Accession XM\_036104). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1863. LIG-1 (Accession XM\_033712) is another VGAM1774 host target gene. LIG-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LIG-1 BINDING SITE, designated SEQ ID:31952, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59344] Another function of VGAM1774 is therefore inhibition of LIG-1 (Accession XM\_033712). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG-1. NCE2 (Accession NM\_080678) is another VGAM1774 host target gene. NCE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCE2 BINDING SITE, designated SEQ ID:27971, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59345] Another function of VGAM1774 is therefore inhibition of NCE2 (Accession NM\_080678). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCE2. Protocadherin 19 (PCDH19, Accession XM\_033173) is an-

other VGAM1774 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31857, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59346] Another function of VGAM1774 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM\_033173). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. RNAC (Accession NM\_005772) is another VGAM1774 host target gene. RNAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAC BINDING SITE, designated SEQ ID:12343, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59347] Another function of VGAM1774 is therefore inhibition of RNAC (Accession NM\_005772). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNAC. STRIN (Accession NM\_016271) is another VGAM1774 host target gene. STRIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRIN BINDING SITE, designated SEQ ID:18394, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59348] Another function of VGAM1774 is therefore inhibition of STRIN (Accession NM\_016271). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRIN. Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033628) is another VGAM1774 host target gene. TREX1 BINDING SITE1 and TREX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 and TREX1 BINDING SITE2, designated SEQ ID:27343 and SEQ ID:27334 respectively, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59349] Another function of VGAM1774 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM\_033628). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC124602 (Accession XM\_058829) is another VGAM1774 host target gene. LOC124602 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124602 BINDING SITE, designated SEQ ID:36755, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59350] Another function of VGAM1774 is therefore inhibition of

LOC124602 (Accession XM\_058829). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124602. LOC163397 (Accession XM\_099133) is another VGAM1774 host target gene. LOC163397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163397 BINDING SITE, designated SEQ ID:42081, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59351] Another function of VGAM1774 is therefore inhibition of LOC163397 (Accession XM\_099133). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163397. LOC203397 (Accession XM\_114695) is another VGAM1774 host target gene. LOC203397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC203397 BINDING SITE, designated SEQ ID:43035, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59352] Another function of VGAM1774 is therefore inhibition of LOC203397 (Accession XM\_114695). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203397. LOC90499 (Accession XM\_032170) is another VGAM1774 host target gene. LOC90499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90499 BINDING SITE, designated SEQ ID:31580, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59353] Another function of VGAM1774 is therefore inhibition of LOC90499 (Accession XM\_032170). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90499. LOC91445 (Accession XM\_018516) is another

VGAM1774 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30368, to the nucleotide sequence of VGAM1774 RNA, herein designated VGAM RNA, also designated SEQ ID:4485.

[59354] Another function of VGAM1774 is therefore inhibition of LOC91445 (Accession XM\_018516). Accordingly, utilities of VGAM1774 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1775 (VGAM1775) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59355] VGAM1775 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1775 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[59356] VGAM1775 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59357] VGAM1775 gene encodes a VGAM1775 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1775 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1775 precursor RNA is designated SEQ ID:1761, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1761 is located at position 994 relative to the genome of Cryphonectria Hypovirus 1.

[59358] VGAM1775 precursor RNA folds onto itself, forming VGAM1775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59359] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1775 folded precursor RNA into VGAM1775 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1775 RNA is designated SEQ ID:4486, and is provided hereinbelow with reference to the sequence listing part.

[59360] VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1775 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59361] VGAM1775 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1775 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1775 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1775 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59362] The complementary binding of VGAM1775 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1775 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1775 host target RNA into VGAM1775 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59363] It is appreciated that VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1775 host target genes. The mRNA of each one of this plurality of VGAM1775 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1775 RNA, herein designated VGAM RNA, and which when bound by VGAM1775 RNA causes inhibition of translation of respective one or more VGAM1775 host target proteins.

[59364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1775 gene, herein designated VGAM GENE, on one or more VGAM1775 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59365] It is yet further appreciated that a function of VGAM1775 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1775 correlate with, and may be deduced from, the identity of the host target genes which VGAM1775 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59366] Nucleotide sequences of the VGAM1775 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1775 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1775 are further described hereinbelow with reference to Table 1.

[59367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1775 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1775 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59368] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1775 gene, herein designated VGAM is inhibition of expression of VGAM1775 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1775 correlate with, and may be deduced from, the identity of the target genes which VGAM1775 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59369] ATP-binding Cassette, Sub-family D (ALD), Member 3 (ABCD3, Accession NM\_002858) is a VGAM1775 host target gene. ABCD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCD3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD3 BINDING SITE, designated SEQ ID:8753, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59370] A function of VGAM1775 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 3 (ABCD3, Accession NM\_002858), a gene which a probable transporter. Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD3. The function of ABCD3 has been established by previous studies. Peroxisomes are single, membrane-bound, spheroid organelles present in virtually all eukaryotic cells. The polypeptide composition of the peroxisomal membrane is distinct from that of other organelles and comprises 2 quantitatively major (22K and 70K) and several minor peroxisomal membrane proteins. The peroxisome matrix contains more than 40 enzymes which are involved in a variety of metabolic processes including peroxide-based respiration, synthesis of plasmalogen and bile acids, beta-oxidation of very long chain fatty acids, and glyoxylate transamination. Biogene-

sis of peroxisomes appears to proceed by import of newly synthesized proteins into existing peroxisomes which enlarge and divide. Most matrix enzymes use an SKL (ser-lys-leu) tripeptide at the C-terminus as a targeting sequence, and the import of at least one, acyl-CoA oxidase, is ATP-dependent. Peroxisomal membrane proteins (PMP), as well as the peroxisomal matrix enzymes, are synthesized on free cytoplasmic polysomes at their mature size. Disorders with defective peroxisome biogenesis include Zellweger syndrome (ZWS1; 214100) and neonatal adrenoleukodystrophy (OMIM Ref. No. 202370). In these disorders, many peroxisomal matrix proteins are mislocated in the cytosol, whereas others, such as PMP70, PMP22 (OMIM Ref. No. 601097), and thiolase precursor, are associated with irregularly shaped vesicles which may be defective peroxisomes or peroxisome precursors. These observations led to the hypothesis that the peroxisome biogenesis defects are due to defective import mechanisms for peroxisomal matrix enzymes. Somatic cell fusion studies indicated the existence of at least 11 complementation groups for ZS and related phenotypes (Moser et al., 1995). PMP70 was mapped to chromosome 1 by analysis of somatic cell hybrid DNAs (Gartner et al.,

1992) and regionalized to 1p22–p21 by fluorescence in situ hybridization (1,2:Gartner et al., 1992, 1993). The gene encoding the mouse homolog of PMP70 (Pmp1) was located on chromosome 3 by interspecific backcross analysis.

[59371] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59372] Moser, A. B.; Rasmussen, M.; Naidu, S.; Watkins, P. A.; McGuinness, M.; Hajra, A. K.; Chen, G.; Raymond, G.; Liu, A.; Gordon, D.; Garnaas, K.; Walton, D. S.; Skjedal, O. H.; Guggenheim, M. A.; Jackson, L. G.; Elias, E. R.; Moser, H. W. : Phenotype of patients with peroxisomal disorders subdivided into sixteen complementation groups. J. Pediat. 127: 13–22, 1995. ; and

[59373] Gartner, J.; Kearns, W.; Pearson, P.; Valle, D. : Characterization and localization of the human 70–kD peroxisomal membrane protein (PMP70) gene. (Abstract) Am. J. Hum. Genet. 51 (suppl.

[59374] Further studies establishing the function and utilities of ABCD3 are found in John Hopkins OMIM database record ID 170995, and in cited publications numbered 10944–10946, 1111 and 11167–11168 listed in the bibli–

ography section hereinbelow, which are also hereby incorporated by reference. ADP-ribosylation Factor 3 (ARF3, Accession NM\_001659) is another VGAM1775 host target gene. ARF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:7381, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59375] Another function of VGAM1775 is therefore inhibition of ADP-ribosylation Factor 3 (ARF3, Accession NM\_001659). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF3. Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644) is another VGAM1775 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:20720 and SEQ ID:27633 respectively, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59376] Another function of VGAM1775 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020) is another VGAM1775 host target gene. LZTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:22009, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59377] Another function of VGAM1775 is therefore inhibition of

Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76. Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1. The function of LZTS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM890. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM\_003768) is another VGAM1775 host target gene. PEA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9852, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59378] Another function of VGAM1775 is therefore inhibition of Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM\_003768), a gene which is a phosphoprotein and

involved in glucose uptake. Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949. Paxillin (PXN, Accession NM\_002859) is another VGAM1775 host target gene. PXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXN BINDING SITE, designated SEQ ID:8756, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59379] Another function of VGAM1775 is therefore inhibition of Paxillin (PXN, Accession NM\_002859), a gene which may be involved in p53-dependent apoptosis. Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXN. The function of PXN and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM132. Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM\_003202) is another VGAM1775 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:9195, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59380] Another function of VGAM1775 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM\_003202). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM\_031910) is another VGAM1775 host target gene. C1QTNF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:25658, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59381] Another function of VGAM1775 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM\_031910). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6. DKFZp761D0614 (Accession XM\_113634) is another VGAM1775 host target gene. DKFZp761D0614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D0614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D0614 BINDING SITE, designated SEQ ID:42311, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59382] Another function of VGAM1775 is therefore inhibition of DKFZp761D0614 (Accession XM\_113634). Accordingly,

utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D0614. FLJ10508 (Accession NM\_018118) is another VGAM1775 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated SEQ ID:19891, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59383] Another function of VGAM1775 is therefore inhibition of FLJ10508 (Accession NM\_018118). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10508. FLJ14297 (Accession NM\_024903) is another VGAM1775 host target gene. FLJ14297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14297

BINDING SITE, designated SEQ ID:24393, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59384] Another function of VGAM1775 is therefore inhibition of FLJ14297 (Accession NM\_024903). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14297. MGC11115 (Accession NM\_032310) is another VGAM1775 host target gene. MGC11115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:26096, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59385] Another function of VGAM1775 is therefore inhibition of MGC11115 (Accession NM\_032310). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. RAB22A, Member RAS Oncogene Family (RAB22A, Accession XM\_009454) is another VGAM1775

host target gene. RAB22A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB22A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB22A BINDING SITE, designated SEQ ID:30111, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59386] Another function of VGAM1775 is therefore inhibition of RAB22A, Member RAS Oncogene Family (RAB22A, Accession XM\_009454). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB22A. LOC115110 (Accession XM\_049825) is another VGAM1775 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35506, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4486.

[59387] Another function of VGAM1775 is therefore inhibition of LOC115110 (Accession XM\_049825). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC130162 (Accession XM\_059406) is another VGAM1775 host target gene. LOC130162 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130162 BINDING SITE, designated SEQ ID:36985, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59388] Another function of VGAM1775 is therefore inhibition of LOC130162 (Accession XM\_059406). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130162. LOC146375 (Accession XM\_085434) is another VGAM1775 host target gene. LOC146375 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146375, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146375 BINDING SITE, designated SEQ ID:38140, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59389] Another function of VGAM1775 is therefore inhibition of LOC146375 (Accession XM\_085434). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146375. LOC151249 (Accession XM\_010852) is another VGAM1775 host target gene. LOC151249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151249 BINDING SITE, designated SEQ ID:30163, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59390] Another function of VGAM1775 is therefore inhibition of LOC151249 (Accession XM\_010852). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151249. LOC153817 (Accession XM\_027964) is another VGAM1775 host target gene. LOC153817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153817 BINDING SITE, designated SEQ ID:30599, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59391] Another function of VGAM1775 is therefore inhibition of LOC153817 (Accession XM\_027964). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153817. LOC199858 (Accession XM\_114040) is another VGAM1775 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42638, to

the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59392] Another function of VGAM1775 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC203378 (Accession XM\_117541) is another VGAM1775 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43560, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59393] Another function of VGAM1775 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC220840 (Accession XM\_165514) is another VGAM1775 host target gene. LOC220840 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220840 BINDING SITE, designated SEQ ID:43659, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59394] Another function of VGAM1775 is therefore inhibition of LOC220840 (Accession XM\_165514). Accordingly, utilities of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220840. LOC253943 (Accession XM\_171195) is another VGAM1775 host target gene. LOC253943 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253943 BINDING SITE, designated SEQ ID:45985, to the nucleotide sequence of VGAM1775 RNA, herein designated VGAM RNA, also designated SEQ ID:4486.

[59395] Another function of VGAM1775 is therefore inhibition of LOC253943 (Accession XM\_171195). Accordingly, utilities

of VGAM1775 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253943. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1776 (VGAM1776) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59396] VGAM1776 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1776 was detected is described hereinabove with reference to Figs. 1-8.

[59397] VGAM1776 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59398] VGAM1776 gene encodes a VGAM1776 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1776 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1776 precursor RNA is designated SEQ ID:1762, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1762 is located at position 9833 relative to the genome of Cryphonectria Hypovirus 1.

[59399] VGAM1776 precursor RNA folds onto itself, forming VGAM1776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59400] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1776 folded precursor RNA into VGAM1776 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1776 RNA is designated SEQ ID:4487, and

is provided hereinbelow with reference to the sequence listing part.

[59401] VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1776 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59402] VGAM1776 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1776 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1776 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59403] The complementary binding of VGAM1776 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1776 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1776 host target RNA into VGAM1776 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59404] It is appreciated that VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1776 host target genes. The mRNA of each one of this plurality of VGAM1776 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1776 RNA, herein designated VGAM RNA, and which when bound by VGAM1776 RNA causes inhibition of translation of respective one or more VGAM1776 host target proteins.

[59405] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1776 gene, herein designated VGAM GENE, on one or more VGAM1776 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59406] It is yet further appreciated that a function of VGAM1776 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1776 correlate with, and may be deduced from, the identity of the host target genes which VGAM1776 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59407] Nucleotide sequences of the VGAM1776 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1776 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1776 are further described hereinbelow with reference to Table 1.

[59408] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1776 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1776 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59409] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1776 gene, herein designated VGAM is inhibition of expression of VGAM1776 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1776 correlate with, and may be deduced from, the identity of the target genes which VGAM1776 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59410] Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455) is a VGAM1776 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10753, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59411] A function of VGAM1776 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1.

The function of EXTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 4 (MLLT4, Accession XM\_051832) is another VGAM1776 host target gene. MLLT4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT4 BINDING SITE, designated SEQ ID:35886, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59412] Another function of VGAM1776 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 4 (MLLT4, Accession XM\_051832), a gene which may act as an intracellular signaling component. Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT4. The function of MLLT4 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1608. Epiregulin (EREG, Accession NM\_001432) is another VGAM1776 host target gene. EREG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EREG BINDING SITE, designated SEQ ID:7156, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59413] Another function of VGAM1776 is therefore inhibition of Epiregulin (EREG, Accession NM\_001432). Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EREG. KIAA0057 (Accession NM\_012288) is another VGAM1776 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0057 BINDING SITE, designated SEQ ID:14627, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59414] Another function of VGAM1776 is therefore inhibition of KIAA0057 (Accession NM\_012288). Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA1500 (Accession XM\_034353) is another VGAM1776 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32064, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59415] Another function of VGAM1776 is therefore inhibition of KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335) is another

VGAM1776 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30686, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59416] Another function of VGAM1776 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335). Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. Solute Carrier Family 2 (facilitated glucose transporter), Member 12 (SLC2A12, Accession NM\_145176) is another VGAM1776 host target gene. SLC2A12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A12 BINDING SITE, designated SEQ ID:29737, to the nucleotide

sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59417] Another function of VGAM1776 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 12 (SLC2A12, Accession NM\_145176). Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A12. LOC153572 (Accession XM\_098392) is another VGAM1776 host target gene. LOC153572 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153572 BINDING SITE, designated SEQ ID:41640, to the nucleotide sequence of VGAM1776 RNA, herein designated VGAM RNA, also designated SEQ ID:4487.

[59418] Another function of VGAM1776 is therefore inhibition of LOC153572 (Accession XM\_098392). Accordingly, utilities of VGAM1776 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153572. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1777 (VGAM1777) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59419] VGAM1777 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1777 was detected is described hereinabove with reference to Figs. 1–8.

[59420] VGAM1777 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59421] VGAM1777 gene encodes a VGAM1777 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1777 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1777 precursor RNA is designated SEQ ID:1763, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1763 is located at position 7246 relative to the genome of Cryphonectria Hypovirus 1.

[59422] VGAM1777 precursor RNA folds onto itself, forming VGAM1777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59423] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1777 folded precursor RNA into VGAM1777 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1777 RNA is designated SEQ ID:4488, and is provided hereinbelow with reference to the sequence listing part.

[59424] VGAM1777 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1777 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59425] VGAM1777 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1777 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1777 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1777 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[59426] The complementary binding of VGAM1777 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1777 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1777 host target RNA into VGAM1777 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59427] It is appreciated that VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1777 host target genes. The mRNA of each one of this plurality of VGAM1777 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1777 RNA, herein designated VGAM RNA, and which when bound by VGAM1777 RNA causes inhibition of translation of respective one or more

VGAM1777 host target proteins.

[59428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1777 gene, herein designated VGAM GENE, on one or more VGAM1777 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59429] It is yet further appreciated that a function of VGAM1777 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1.

Specific functions, and accordingly utilities, of VGAM1777 correlate with, and may be deduced from, the identity of the host target genes which VGAM1777 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59430] Nucleotide sequences of the VGAM1777 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1777 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1777 are further described hereinbelow with reference to Table 1.

[59431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1777 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1777 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59432] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1777 gene, herein designated VGAM is inhibition of expression of VGAM1777 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1777 correlate with, and may be deduced from, the identity of the target genes which VGAM1777 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59433] Glutamate Dehydrogenase 1 (GLUD1, Accession NM\_005271) is a VGAM1777 host target gene. GLUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUD1 BINDING SITE, designated SEQ ID:11773, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59434] A function of VGAM1777 is therefore inhibition of Glutamate Dehydrogenase 1 (GLUD1, Accession NM\_005271). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUD1. RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422) is another VGAM1777 host target gene. RAD52 BINDING SITE1 and RAD52 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

RAD52, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE1 and RAD52 BINDING SITE2, designated SEQ ID:28648 and SEQ ID:28656 respectively, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59435] Another function of VGAM1777 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM\_134422). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. DKFZP434O047 (Accession NM\_015594) is another VGAM1777 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434O047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17867, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59436] Another function of VGAM1777 is therefore inhibition of DKFZP434O047 (Accession NM\_015594). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295) is another VGAM1777 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34942, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59437] Another function of VGAM1777 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ14126 (Accession NM\_024849) is another VGAM1777 host target gene. FLJ14126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ14126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14126 BINDING SITE, designated SEQ ID:24282, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59438] Another function of VGAM1777 is therefore inhibition of FLJ14126 (Accession NM\_024849). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14126. G Protein-coupled Receptor 107 (GPR107, Accession NM\_020960) is another VGAM1777 host target gene. GPR107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR107 BINDING SITE, designated SEQ ID:21950, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59439] Another function of VGAM1777 is therefore inhibition of G

Protein-coupled Receptor 107 (GPR107, Accession NM\_020960). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR107. HSGP25L2G (Accession XM\_030771) is another VGAM1777 host target gene. HSGP25L2G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSGP25L2G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSGP25L2G BINDING SITE, designated SEQ ID:31134, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59440] Another function of VGAM1777 is therefore inhibition of HSGP25L2G (Accession XM\_030771). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSGP25L2G. Neuromedin U Receptor 2 (NMU2R, Accession NM\_020167) is another VGAM1777 host target gene. NMU2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NMU2R, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NMU2R BINDING SITE, designated SEQ ID:21384, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59441] Another function of VGAM1777 is therefore inhibition of Neuromedin U Receptor 2 (NMU2R, Accession NM\_020167). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NMU2R. NYD-SP11 (Accession NM\_031951) is another VGAM1777 host target gene. NYD-SP11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NYD-SP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP11 BINDING SITE, designated SEQ ID:25691, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59442] Another function of VGAM1777 is therefore inhibition of NYD-SP11 (Accession NM\_031951). Accordingly, utilities

of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP11. SQV7L (Accession XM\_047287) is another VGAM1777 host target gene. SQV7L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SQV7L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SQV7L BINDING SITE, designated SEQ ID:34932, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59443] Another function of VGAM1777 is therefore inhibition of SQV7L (Accession XM\_047287). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SQV7L. ZER6 (Accession XM\_032742) is another VGAM1777 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ

ID:31739, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59444] Another function of VGAM1777 is therefore inhibition of ZER6 (Accession XM\_032742). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. LOC158434 (Accession XM\_098939) is another VGAM1777 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41985, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59445] Another function of VGAM1777 is therefore inhibition of LOC158434 (Accession XM\_098939). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC165741 (Accession XM\_105272) is another VGAM1777 host target gene. LOC165741 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165741, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165741 BINDING SITE, designated SEQ ID:42189, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59446] Another function of VGAM1777 is therefore inhibition of LOC165741 (Accession XM\_105272). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165741. LOC90342 (Accession XM\_031009) is another VGAM1777 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31249, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59447] Another function of VGAM1777 is therefore inhibition of

LOC90342 (Accession XM\_031009). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. LOC92689 (Accession XM\_046663) is another VGAM1777 host target gene. LOC92689 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92689 BINDING SITE, designated SEQ ID:34780, to the nucleotide sequence of VGAM1777 RNA, herein designated VGAM RNA, also designated SEQ ID:4488.

[59448] Another function of VGAM1777 is therefore inhibition of LOC92689 (Accession XM\_046663). Accordingly, utilities of VGAM1777 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92689. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1778 (VGAM1778) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[59449] VGAM1778 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1778 was detected is described hereinabove with reference to Figs. 1–8.

[59450] VGAM1778 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59451] VGAM1778 gene encodes a VGAM1778 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1778 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1778 precursor RNA is designated SEQ ID:1764, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1764 is located at position 3023 relative to the genome of Cryphonectria Hypovirus 1.

[59452] VGAM1778 precursor RNA folds onto itself, forming VGAM1778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59453] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1778 folded precursor RNA into VGAM1778 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1778 RNA is designated SEQ ID:4489, and is provided hereinbelow with reference to the sequence listing part.

[59454] VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1778 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59455] VGAM1778 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1778 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1778 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[59456] The complementary binding of VGAM1778 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1778 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1778 host target RNA into VGAM1778 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59457] It is appreciated that VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1778 host target genes. The mRNA of each one of this plurality of VGAM1778 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1778 RNA, herein designated VGAM RNA, and which when bound by VGAM1778 RNA causes inhibition of translation of respective one or more VGAM1778 host target proteins.

[59458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1778 gene, herein designated VGAM GENE, on one

or more VGAM1778 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59459] It is yet further appreciated that a function of VGAM1778 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1778 correlate with, and may be deduced from, the identity of the host target genes which VGAM1778 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59460] Nucleotide sequences of the VGAM1778 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1778 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1778 are further described hereinbelow with reference to Table 1.

[59461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1778 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1778 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59462] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1778 gene, herein designated VGAM is inhibition of expression of VGAM1778 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1778 correlate with, and may be deduced from, the identity of the target genes which VGAM1778 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59463] DnaJ (Hsp40) Homolog, Subfamily B, Member 1 (DNAJB1,

Accession NM\_006145) is a VGAM1778 host target gene. DNAJB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB1 BINDING SITE, designated SEQ ID:12788, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59464] A function of VGAM1778 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 1 (DNAJB1, Accession NM\_006145), a gene which may prevent aggregation of newly translated proteins. Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB1. The function of DNAJB1 has been established by previous studies. The E. coli heat-shock protein DnaJ (see OMIM Ref. No. 140550) functions together with DnaK (HSPA1A; 140550) and GrpE (OMIM Ref. No. 606173) as a molecular chaperone, involving them in assembly and disassembly of protein complexes, protein folding, renaturation of denatured proteins, prevention of protein aggre-

gation, and protein export. By screening a human placenta cDNA library with anti-hsp40 antibody, Ohtsuka (1993) isolated a cDNA encoding a 40-kD heat-shock protein designated HSPF1. The deduced 340-amino acid HSPF1 protein is 34% identical to E. coli DnaJ and 34% and 36% identical to HSJ1 (OMIM Ref. No. 604139) and HSJ2 (OMIM Ref. No. 602837), respectively. By Northern blot analysis, Hata and Ohtsuka (1998) showed that expression of a major 2.4-kb and a minor 1.4-kb HSPF1 transcript is drastically induced by heat shock. Several dominant human neurodegenerative diseases involve the expansion of a polyglutamine within the disease proteins. This expansion confers toxicity on the proteins and is associated with nuclear inclusion formation. Data indicate that molecular chaperones can modulate polyglutamine pathogenesis. To elucidate the basis of polyglutamine toxicity and the mechanism by which chaperones suppress neurodegeneration, Chan et al. (2000) studied transgenic Drosophila disease models of Machado-Joseph disease (OMIM Ref. No. 109150) and Huntington disease (OMIM Ref. No. 143100). They demonstrated that Hsp70 (see OMIM Ref. No. 140559) and Hdj1, the Drosophila homolog to human HSP40 (see OMIM Ref. No. 604139), showed

substrate specificity for polyglutamine proteins as well as synergy in suppression of neurotoxicity, and altered the solubility properties of the mutant polyglutamine protein.

[59465] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59466] Chan, H. Y. E.; Warrick, J. M.; Gray-Board, G. L.; Paulson, H. L.; Bonini, N. M. : Mechanisms of chaperone suppression of polyglutamine disease: selectivity, synergy and modulation of protein solubility in *Drosophila*. *Hum. Molec. Genet.* 9: 2811–2820, 2000. ; and

[59467] Hata, M.; Ohtsuka, K. : Characterization of HSE sequences in human Hsp40 gene: structural and promoter analysis. *Biochim. Biophys. Acta* 1397: 43–55, 1998.

[59468] Further studies establishing the function and utilities of DNAJB1 are found in John Hopkins OMIM database record ID 604572, and in cited publications numbered 522 and 7947–7949 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein-coupled Receptor 75 (GPR75, Accession NM\_006794) is another VGAM1778 host target gene. GPR75 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR75, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR75 BINDING SITE, designated SEQ ID:13669, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59469] Another function of VGAM1778 is therefore inhibition of G Protein-coupled Receptor 75 (GPR75, Accession NM\_006794). Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR75. Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM\_000195) is another VGAM1778 host target gene. HPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPS1 BINDING SITE, designated SEQ ID:5693, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59470] Another function of VGAM1778 is therefore inhibition of Hermansky-Pudlak Syndrome 1 (HPS1, Accession

NM\_000195). Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS1. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 3A1 (HS3ST3A1, Accession NM\_006042) is another VGAM1778 host target gene. HS3ST3A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HS3ST3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST3A1 BINDING SITE, designated SEQ ID:12676, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59471] Another function of VGAM1778 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 3A1 (HS3ST3A1, Accession NM\_006042), a gene which plays a role in the generation of heparan sulfate proteoglycan. Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST3A1. The function of HS3ST3A1 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM1454.RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM1778 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13664, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59472] Another function of VGAM1778 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345.Transient Receptor Potential Cation Channel,

Subfamily V, Member 1 (TRPV1, Accession NM\_080705) is another VGAM1778 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:27999, SEQ ID:28007, SEQ ID:20811 and SEQ ID:27991 respectively, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59473] Another function of VGAM1778 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM\_080705), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146.LOC219649 (Accession XM\_167562) is another VGAM1778 host target gene.

LOC219649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:44669, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59474] Another function of VGAM1778 is therefore inhibition of LOC219649 (Accession XM\_167562). Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649. LOC91828 (Accession XM\_040910) is another VGAM1778 host target gene. LOC91828 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91828 BINDING SITE, designated SEQ ID:33408, to the nucleotide sequence of VGAM1778 RNA, herein designated VGAM RNA, also designated SEQ ID:4489.

[59475] Another function of VGAM1778 is therefore inhibition of LOC91828 (Accession XM\_040910). Accordingly, utilities of VGAM1778 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91828. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1779 (VGAM1779) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59476] VGAM1779 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1779 was detected is described hereinabove with reference to Figs. 1–8.

[59477] VGAM1779 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59478] VGAM1779 gene encodes a VGAM1779 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1779 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1779 precursor RNA is designated SEQ ID:1765, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1765 is located at position 4059 relative to the genome of Cryphonectria Hypovirus 1.

[59479] VGAM1779 precursor RNA folds onto itself, forming VGAM1779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59480] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1779 folded precursor RNA into VGAM1779 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1779 RNA is designated SEQ ID:4490, and is provided hereinbelow with reference to the sequence listing part.

[59481] VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1779 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59482] VGAM1779 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1779 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1779 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59483] The complementary binding of VGAM1779 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1779 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1779 host target RNA into VGAM1779 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59484] It is appreciated that VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1779 host target genes. The mRNA of each one of this plurality of VGAM1779 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1779 RNA, herein designated VGAM RNA, and which when bound by VGAM1779 RNA causes inhibition of translation of respective one or more VGAM1779 host target proteins.

[59485] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1779 gene, herein designated VGAM GENE, on one or more VGAM1779 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59486] It is yet further appreciated that a function of VGAM1779 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1779 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1779 correlate with, and may be deduced from, the identity of the host target genes which VGAM1779 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59487] Nucleotide sequences of the VGAM1779 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1779 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1779 are further described hereinbelow with reference to Table 1.

[59488] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1779 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1779 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[59489] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1779 gene, herein designated VGAM is inhibition of expression of VGAM1779 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1779 correlate with, and may be deduced from, the identity of the target genes which VGAM1779 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59490] Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM\_002483) is a VGAM1779 host target gene. CEACAM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM6 BINDING SITE, designated SEQ ID:8309, to the nucleotide sequence of VGAM1779 RNA, herein designated VGAM RNA, also designated SEQ ID:4490.

[59491] A function of VGAM1779 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 6

(non-specific cross reacting antigen) (CEACAM6, Accession NM\_002483), a gene which Non-specific cross reacting antigen (. Accordingly, utilities of VGAM1779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM6. The function of CEACAM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM286. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112) is another VGAM1779 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15351, to the nucleotide sequence of VGAM1779 RNA, herein designated VGAM RNA, also designated SEQ ID:4490.

[59492] Another function of VGAM1779 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM\_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of

VGAM1779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Actin Related Protein 2/3 Complex, Subunit 5, 16kDa (ARPC5, Accession NM\_005717) is another VGAM1779 host target gene. ARPC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPC5 BINDING SITE, designated SEQ ID:12272, to the nucleotide sequence of VGAM1779 RNA, herein designated VGAM RNA, also designated SEQ ID:4490.

[59493] Another function of VGAM1779 is therefore inhibition of Actin Related Protein 2/3 Complex, Subunit 5, 16kDa (ARPC5, Accession NM\_005717). Accordingly, utilities of VGAM1779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPC5. FLJ23056 (Accession NM\_024582) is another VGAM1779 host target gene. FLJ23056 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ23056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23056 BINDING SITE, designated SEQ ID:23808, to the nucleotide sequence of VGAM1779 RNA, herein designated VGAM RNA, also designated SEQ ID:4490.

[59494] Another function of VGAM1779 is therefore inhibition of FLJ23056 (Accession NM\_024582). Accordingly, utilities of VGAM1779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23056. LOC51141 (Accession XM\_043953) is another VGAM1779 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34048, to the nucleotide sequence of VGAM1779 RNA, herein designated VGAM RNA, also designated SEQ ID:4490.

[59495] Another function of VGAM1779 is therefore inhibition of

LOC51141 (Accession XM\_043953). Accordingly, utilities of VGAM1779 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1780 (VGAM1780) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59496] VGAM1780 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1780 was detected is described hereinabove with reference to Figs. 1-8.

[59497] VGAM1780 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59498] VGAM1780 gene encodes a VGAM1780 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1780 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1780 precursor RNA is designated SEQ ID:1766, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1766 is located at position 6807 relative to the genome of Cryphonectria Hypovirus 1.

- [59499] VGAM1780 precursor RNA folds onto itself, forming VGAM1780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [59500] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1780 folded precursor RNA into VGAM1780 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide se-

quence of VGAM1780 RNA is designated SEQ ID:4491, and is provided hereinbelow with reference to the sequence listing part.

[59501] VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1780 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59502] VGAM1780 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1780 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1780 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59503] The complementary binding of VGAM1780 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1780 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1780 host target RNA into VGAM1780 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59504] It is appreciated that VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1780 host target genes. The mRNA of each one of this plurality of VGAM1780 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1780 RNA, herein designated VGAM RNA, and which when bound by VGAM1780 RNA causes inhibition of translation of respective one or more VGAM1780 host target proteins.

[59505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1780 gene, herein designated VGAM GENE, on one or more VGAM1780 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59506] It is yet further appreciated that a function of VGAM1780

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1780 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1780 correlate with, and may be deduced from, the identity of the host target genes which VGAM1780 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59507] Nucleotide sequences of the VGAM1780 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1780 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1780 are further described hereinbelow with reference to Table 1.

[59508] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1780 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1780 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59509] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1780 gene, herein designated VGAM is inhibition of expression of VGAM1780 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1780 correlate with, and may be deduced from, the identity of the target genes which VGAM1780 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59510] Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020) is a VGAM1780 host target gene. LZTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTS1 BINDING SITE, designated SEQ ID:22005, to the nucleotide sequence of VGAM1780 RNA, herein designated VGAM RNA, also designated SEQ ID:4491.

[59511] A function of VGAM1780 is therefore inhibition of Leucine Zipper, Putative Tumor Suppressor 1 (LZTS1, Accession NM\_021020), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76.

Accordingly, utilities of VGAM1780 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTS1. The function of LZTS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM890. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1781 (VGAM1781) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59512] VGAM1781 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1781 was detected is described hereinabove with reference to Figs. 1–8.

[59513] VGAM1781 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59514] VGAM1781 gene encodes a VGAM1781 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1781 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1781 precursor RNA is designated SEQ ID:1767, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1767 is located at position 9633 relative to the genome of Cryphonectria Hypovirus 1.

- [59515] VGAM1781 precursor RNA folds onto itself, forming VGAM1781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [59516] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1781 folded precursor RNA into VGAM1781 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1781 RNA is designated SEQ ID:4492, and is provided hereinbelow with reference to the sequence listing part.

[59517] VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1781 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59518] VGAM1781 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1781 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1781 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59519] The complementary binding of VGAM1781 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1781 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1781 host target RNA into VGAM1781 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59520] It is appreciated that VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1781 host target genes. The mRNA of

each one of this plurality of VGAM1781 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1781 RNA, herein designated VGAM RNA, and which when bound by VGAM1781 RNA causes inhibition of translation of respective one or more VGAM1781 host target proteins.

[59521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1781 gene, herein designated VGAM GENE, on one or more VGAM1781 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[59522] It is yet further appreciated that a function of VGAM1781 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1781 correlate with, and may be deduced from, the identity of the host target genes which VGAM1781 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59523] Nucleotide sequences of the VGAM1781 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1781 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1781 are further described hereinbelow with reference to Table 1.

[59524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1781 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1781 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59525] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1781 gene, herein designated VGAM is inhibition of expression of VGAM1781 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1781 correlate with, and may be deduced from, the identity of the target genes which VGAM1781 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59526] Centrosomal Protein 2 (CEP2, Accession NM\_006779) is a VGAM1781 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:13650, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59527] A function of VGAM1781 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM\_006779), a gene which interacts with TC10 and CDC42. Accordingly, utili-

ties of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. CERD4 (Accession NM\_012074) is another VGAM1781 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14344, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59528] Another function of VGAM1781 is therefore inhibition of CERD4 (Accession NM\_012074). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM\_000162) is another VGAM1781 host target gene. GCK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by GCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCK BINDING SITE, designated SEQ ID:5670, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59529] Another function of VGAM1781 is therefore inhibition of Glucokinase (hexokinase 4, maturity onset diabetes of the young 2) (GCK, Accession NM\_000162), a gene which catalyzes the initial step in utilization of glucose by the beta-cell and liver at physiological glucose concentration. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCK. The function of GCK has been established by previous studies. B lymphocytes that reside in the germinal center of lymphoid follicles are functionally and phenotypically distinct from those residing in the surrounding mantle zone. Various regulatory and structural genes control a complex series of differentiation and selection steps through which B cells that exit the germinal center of lymphoid follicles must pass. In differential hybridization studies to identify some of these genes, Katz

et al. (1994) isolated a novel gene based on its preferential expression in tonsillar germinal center B lymphocytes. The complete nucleotide sequence predicted a 819-amino acid protein, named GC (for 'germinal center') kinase, with homology to serine-threonine protein kinases. Its catalytic domain was 39% and 37% identical to those of *S. cerevisiae* STE20 and *Drosophila* NinaC proteins, respectively. Northern blot analysis revealed expression of a 2.9-kb mRNA in several human tissues, including brain, lung, and placenta. In situ hybridization of tonsil tissue demonstrated preferential hybridization to the germinal center region. The expressed protein phosphorylated casein and myelin basic protein in in vitro kinase assays. Pombo et al. (1995) showed that GC kinase, or GCK, specifically activates the SAPK (OMIM Ref. No. 601335) pathway. They also showed that GCK is activated in situ by TNF- $\alpha$  (OMIM Ref. No. 191160), a potent SAPK agonist. The authors suggested that the SAPK pathway may be active in the differentiation and selection of B cells in the germinal center

[59530] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [59531] Katz, P.; Whalen, G.; Kehrl, J. H. : Differential expression of a novel protein kinase in human B lymphocytes: preferential localization in the germinal center. J. Biol. Chem. 269: 16802–16809, 1994. ; and
- [59532] Ren, M.; Zeng, J.; De Lemos–Chiarandini, C.; Rosenfeld, M.; Adesnik, M.; Sabatini, D. D. : In its active form, the GTP–binding protein rab8 interacts with a stress–activated protein kina.
- [59533] Further studies establishing the function and utilities of GCK are found in John Hopkins OMIM database record ID 603166, and in cited publications numbered 11498–5866 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943) is another VGAM1781 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38413, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ

ID:4492.

[59534] Another function of VGAM1781 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Human Immunodeficiency Virus Type I Enhancer Binding Protein 3 (HIVEP3, Accession NM\_024503) is another VGAM1781 host target gene. HIVEP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HIVEP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIVEP3 BINDING SITE, designated SEQ ID:23698, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59535] Another function of VGAM1781 is therefore inhibition of

Human Immunodeficiency Virus Type I Enhancer Binding Protein 3 (HIVEP3, Accession NM\_024503), a gene which is required for transcriptional activation of glucose- re-pressible alcohol dehydrogenase (adh2). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIVEP3. The function of HIVEP3 has been established by previous studies. Hicar et al. (2001) cloned HIVEP3, a member of the HIVEP family (see OMIM Ref. No. HIVEP1; 194540). HIVEPs encode large zinc finger proteins and regulate transcription via the kappa-B enhancer motif. HIVEP3 is homologous to the mouse Krc (kappa-B-binding and recognition component of the V(D)J recombination signal sequence) protein. The largest open reading frame of HIVEP3 contains 2,406 amino acids and is 80% identical to Krc. RNA studies showed that multiple HIVEP3 transcripts are differentially expressed and regulated. Transcription termination occurs in the ultimate exon, exon 10, or in exon 6. Therefore, HIVEP3 may produce protein isoforms that contain or exclude the C-terminal DNA-binding domain and the leucine zipper by alternative RNA splicing and differential polyadenylation. GENE FUNCTION Oukka et al. (2002) described a function for the zinc fin-

ger transcription factor Krc in regulating patterns of gene activation in response to proinflammatory stimuli. Krc overexpression inhibited, while antisense or dominant-negative Krc enhanced, NF-kappa-B (OMIM Ref. No. 164011)-dependent transactivation and JNK (OMIM Ref. No. 601158) phosphorylation and consequently inhibited apoptosis and cytokine gene expression. The effect of Krc was mediated through its interaction with the adaptor protein TRAF2 (OMIM Ref. No. 601895). Oukka et al. (2002) concluded that Krc is a participant in the signal transduction pathway leading from the TNF receptor (see OMIM Ref. No. 602746) to gene activation and may play a critical role in inflammatory and apoptotic responses.

[59536] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59537] Hicar, M. D.; Liu, Y.; Allen, C. E.; Wu, L.-C. : Structure of the human zinc finger protein HIVEP3: molecular cloning, expression, exon-intron structure, and comparison with paralogous genes HIVEP1 and HIVEP2. *Genomics* 71: 89-100, 2001. ; and

[59538] Oukka, M.; Kim, S. T.; Lugo, G.; Sun, J.; Wu, L.-C.; Glimcher, L. H. : A mammalian homolog of *Drosophila*

schnurri, KRC, regulates TNF receptor-driven responses and interacts with TRAF2.

[59539] Further studies establishing the function and utilities of HIVEP3 are found in John Hopkins OMIM database record ID 606649, and in cited publications numbered 613 and 6144 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prostaglandin F Receptor (FP) (PTGFR, Accession NM\_000959) is another VGAM1781 host target gene. PTGFR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFR BINDING SITE, designated SEQ ID:6661, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59540] Another function of VGAM1781 is therefore inhibition of Prostaglandin F Receptor (FP) (PTGFR, Accession NM\_000959), a gene which mediates intracellular calcium flux, strongly similar to murine Ptgfr. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PTGFR. The function of PTGFR has been established by previous studies. Prostaglandin F(2- $\alpha$ ) is involved in a number of physiologic processes. It serves as a potent luteolytic agent in many species, has been implicated as a modulator of intraocular pressure, and may be important in smooth muscle contraction in the uterus and elsewhere. Its effects on cells are mediated through specific interaction with prostaglandin receptors. Abramovitz et al.

(1994) cloned a cDNA encoding the human prostanoid FP receptor from a uterus cDNA library. The 359-amino acid protein has 7 putative transmembrane domains characteristic of the G protein-coupled receptors. As expected, expression studies of the cDNA in *Xenopus* oocytes and COS cells showed strongest binding to PGF(2- $\alpha$ ). Subsequently, Duncan et al. (1995) mapped the gene to 1p31.1 by in situ hybridization. Using a panel of interspecific backcross mice, Ishikawa et al. (1996) mapped the *Ptgfr* gene to distal mouse chromosome 3. Sugimoto et al. (1997) showed that knockout mice lacking the receptor for prostaglandin F(2- $\alpha$ ) are unable to deliver normal fetuses at term due to a lack of response to oxytocin. The mice also failed to show the decline in serum progesterone expected to precede parturition. However, if the

mice had their ovaries removed at day 19 of pregnancy, normal delivery occurred. The authors concluded that parturition is initiated when prostaglandin F(2- $\alpha$ ) interacts with its receptor in ovarian luteal cells to induce luteolysis. Sugimoto et al. (1997) also suggested that this mechanism may explain why aspirin-like drugs delay parturition.

[59541] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59542] Sugimoto, Y.; Yamasaki, A.; Segi, E.; Tsuboi, K.; Aze, Y.; Nishimura, T.; Oida, H.; Yoshida, N.; Tanaka, T.; Katsuyama, M.; Hasumoto, K.; Murata, T.; Hirata, M.; Ushikubi, F.; Negishi, M.; Ichikawa, A.; Narumiya, S. : Failure of parturition in mice lacking the prostaglandin F receptor. *Science* 277: 681–683, 1997. ; and

[59543] Ishikawa, T.; Tamai, Y.; Rochelle, J. M.; Hirata, M.; Namba, T.; Sugimoto, Y.; Ichikawa, A.; Narumiya, S.; Taketo, M. M.; Seldin, M. F. : Mapping of the genes encoding mouse prostaglandi.

[59544] Further studies establishing the function and utilities of PTGFR are found in John Hopkins OMIM database record ID 600563, and in cited publications numbered 8166–816

and 10839 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063) is another VGAM1781 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11489, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59545] Another function of VGAM1781 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314. Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM\_003270) is another VGAM1781

host target gene. TM4SF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TM4SF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF6 BINDING SITE, designated SEQ ID:9284, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59546] Another function of VGAM1781 is therefore inhibition of Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM\_003270), a gene which plays a role in the regulation of cell development, activation, growth and motility. Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF6. The function of TM4SF6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM84.13CDNA73 (Accession NM\_023037) is another VGAM1781 host target gene. 13CDNA73 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by 13CDNA73, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 13CDNA73 BINDING SITE, designated SEQ ID:23321, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59547] Another function of VGAM1781 is therefore inhibition of 13CDNA73 (Accession NM\_023037). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 13CDNA73. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM\_017575) is another VGAM1781 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19002, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59548] Another function of VGAM1781 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Ac-

cession NM\_017575). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31.

FLJ13241 (Accession NM\_025088) is another VGAM1781 host target gene. FLJ13241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:24706, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59549] Another function of VGAM1781 is therefore inhibition of FLJ13241 (Accession NM\_025088). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241. FLJ14743 (Accession XM\_042708) is another VGAM1781 host target gene. FLJ14743 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ14743 BINDING SITE, designated SEQ ID:33762, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59550] Another function of VGAM1781 is therefore inhibition of FLJ14743 (Accession XM\_042708). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14743. GMPPB (Accession XM\_171044) is another VGAM1781 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45811, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59551] Another function of VGAM1781 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. KIAA0445 (Accession NM\_014675) is another VGAM1781

host target gene. KIAA0445 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0445 BINDING SITE, designated SEQ ID:16146, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59552] Another function of VGAM1781 is therefore inhibition of KIAA0445 (Accession NM\_014675). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0445. KIAA0478 (Accession NM\_014870) is another VGAM1781 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16976, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59553] Another function of VGAM1781 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1018 (Accession NM\_014967) is another VGAM1781 host target gene. KIAA1018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1018 BINDING SITE, designated SEQ ID:17356, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59554] Another function of VGAM1781 is therefore inhibition of KIAA1018 (Accession NM\_014967). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1018. MGC2477 (Accession NM\_024099) is another VGAM1781 host target gene. MGC2477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2477, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE, designated SEQ ID:23541, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59555] Another function of VGAM1781 is therefore inhibition of MGC2477 (Accession NM\_024099). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2477. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM\_080792) is another VGAM1781 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28052, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59556] Another function of VGAM1781 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM\_080792). Accordingly,

utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. Tigger Transposable Element Derived 5 (TIGD5, Accession NM\_032862) is another VGAM1781 host target gene. TIGD5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TIGD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIGD5 BINDING SITE, designated SEQ ID:26667, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59557] Another function of VGAM1781 is therefore inhibition of Tigger Transposable Element Derived 5 (TIGD5, Accession NM\_032862). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIGD5. Thyroid Hormone Receptor Interactor 13 (TRIP13, Accession NM\_004237) is another VGAM1781 host target gene. TRIP13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP13, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP13 BINDING SITE, designated SEQ ID:10435, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59558] Another function of VGAM1781 is therefore inhibition of Thyroid Hormone Receptor Interactor 13 (TRIP13, Accession NM\_004237). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP13. LOC115110 (Accession XM\_049825) is another VGAM1781 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35508, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59559] Another function of VGAM1781 is therefore inhibition of LOC115110 (Accession XM\_049825). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC115110. LOC149579 (Accession XM\_048743) is another VGAM1781 host target gene. LOC149579 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149579 BINDING SITE, designated SEQ ID:35242, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59560] Another function of VGAM1781 is therefore inhibition of LOC149579 (Accession XM\_048743). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149579. LOC154386 (Accession XM\_087920) is another VGAM1781 host target gene. LOC154386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154386 BINDING SITE, designated SEQ ID:39471, to

the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59561] Another function of VGAM1781 is therefore inhibition of LOC154386 (Accession XM\_087920). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154386. LOC256158 (Accession XM\_175125) is another VGAM1781 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46624, to the nucleotide sequence of VGAM1781 RNA, herein designated VGAM RNA, also designated SEQ ID:4492.

[59562] Another function of VGAM1781 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM1781 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1782 (VGAM1782) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59563] VGAM1782 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1782 was detected is described hereinabove with reference to Figs. 1–8.

[59564] VGAM1782 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59565] VGAM1782 gene encodes a VGAM1782 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1782 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1782 precursor RNA is designated SEQ ID:1768, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1768 is located at position 9154 relative to the genome of Cryphonectria Hypovirus 1.

[59566] VGAM1782 precursor RNA folds onto itself, forming VGAM1782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59567] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1782 folded precursor RNA into VGAM1782 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1782 RNA is designated SEQ ID:4493, and is provided hereinbelow with reference to the sequence listing part.

[59568] VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1782 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1782 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59569] VGAM1782 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1782 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1782 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59570] The complementary binding of VGAM1782 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1782 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1782 host target RNA into VGAM1782 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59571] It is appreciated that VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1782 host target genes. The mRNA of each one of this plurality of VGAM1782 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1782 RNA, herein designated VGAM RNA, and which when bound by VGAM1782 RNA causes inhibition of translation of respective one or more VGAM1782 host target proteins.

[59572] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1782 gene, herein designated VGAM GENE, on one or more VGAM1782 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59573] It is yet further appreciated that a function of VGAM1782 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM1782 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1782 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59574] Nucleotide sequences of the VGAM1782 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1782 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1782 are further described hereinbelow with reference to Table 1.

[59575] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1782 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1782 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59576] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1782 gene, herein designated VGAM is inhibition of expression of VGAM1782 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1782 correlate with, and may be deduced from, the identity of the target genes which VGAM1782

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59577] Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007294) is a VGAM1782 host target gene. BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BRCA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10, designated SEQ ID:14164, SEQ ID:14201, SEQ ID:14189, SEQ ID:14209, SEQ ID:14221, SEQ ID:14195, SEQ ID:14170, SEQ ID:14182, SEQ ID:14215 and SEQ ID:14176 respectively, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59578] A function of VGAM1782 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007294). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Heat Shock 70kDa Protein 5 (glucose-regulated protein, 78kDa) (HSPA5, Accession NM\_005347) is another VGAM1782 host target gene.

HSPA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA5 BINDING SITE, designated SEQ ID:11820, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59579] Another function of VGAM1782 is therefore inhibition of Heat Shock 70kDa Protein 5 (glucose-regulated protein, 78kDa) (HSPA5, Accession NM\_005347), a gene which is involved in the folding and assembly of proteins in the endoplasmic reticulum (ER). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA5. The function of HSPA5 has been established by previous studies. Hendershot et al. (1994) pointed out that GRP78, also referred to as 'immunoglobulin heavy chain-binding protein' (BiP), is a member of the heat-shock protein-70 (HSP70) family and is involved in the folding and assembly of proteins in the endoplasmic reticulum (ER). Because so many ER proteins interact with GRP78 transiently, it may

play a key role in monitoring protein transport through the cell. To examine how the binding of BiP influences the conformational maturation of thyroglobulin (TG; 188450), Muresan and Arvan (1998) expressed TG in Chinese hamster ovary (CHO) cells genetically manipulated for selectively increased BiP expression (CHO-B cells). The TG expressed in CHO-B cells did not contain any mutations that induce misfolding (i.e., no unfolded protein response), so that levels of all other ER chaperones were normal. Increased availability of BiP did not accelerate TG secretion; rather, the export of newly synthesized TG was delayed. TG that was detained intracellularly was concentrated in the ER. Muresan and Arvan (1998) concluded that increased binding of BiP to TG leads to its delayed conformational maturation in the ER.

[59580] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59581] Hendershot, L. M.; Valentine, V. A.; Lee, A. S.; Morris, S. W.; Shapiro, D. N. : Localization of the gene encoding human BiP/GRP78, the endoplasmic reticulum cognate of the HSP70 family, to chromosome 9q34. *Genomics* 20: 281-284, 1994. ; and

[59582] Muresan, Z.; Arvan, P. : Enhanced binding to the molecular chaperone BiP slows thyroglobulin export from the endoplasmic reticulum. *Molec. Endocr.* 12: 458–467, 1998.

[59583] Further studies establishing the function and utilities of HSPA5 are found in John Hopkins OMIM database record ID 138120, and in cited publications numbered 1696–170 and 12097 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prostaglandin I<sub>2</sub> (prostacyclin) Synthase (PTGIS, Accession NM\_000961) is another VGAM1782 host target gene. PTGIS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGIS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:6669, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59584] Another function of VGAM1782 is therefore inhibition of Prostaglandin I<sub>2</sub> (prostacyclin) Synthase (PTGIS, Accession NM\_000961), a gene which catalyzes the isomerization of prostaglandin h<sub>2</sub> to prostacyclin (= prostaglandin i<sub>2</sub>). Accordingly, utilities of VGAM1782 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PTGIS. The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.FLJ10781 (Accession NM\_018215) is another VGAM1782 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20134, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59585] Another function of VGAM1782 is therefore inhibition of FLJ10781 (Accession NM\_018215). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. FLJ14397 (Accession NM\_032779) is another VGAM1782 host target gene. FLJ14397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14397, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14397 BINDING SITE, designated SEQ ID:26522, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59586] Another function of VGAM1782 is therefore inhibition of FLJ14397 (Accession NM\_032779). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14397. KIAA1582 (Accession XM\_037262) is another VGAM1782 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32589, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59587] Another function of VGAM1782 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1582. MGC9564 (Accession NM\_080669) is another VGAM1782 host target gene. MGC9564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC9564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9564 BINDING SITE, designated SEQ ID:27961, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59588] Another function of VGAM1782 is therefore inhibition of MGC9564 (Accession NM\_080669). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9564. Solute Carrier Family 26, Member 6 (SLC26A6, Accession NM\_022911) is another VGAM1782 host target gene. SLC26A6 BINDING SITE1 through SLC26A6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC26A6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A6

BINDING SITE1 through SLC26A6 BINDING SITE3, designated SEQ ID:23217, SEQ ID:28666 and SEQ ID:28612 respectively, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59589] Another function of VGAM1782 is therefore inhibition of Solute Carrier Family 26, Member 6 (SLC26A6, Accession NM\_022911). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A6. LOC150299 (Accession XM\_097869) is another VGAM1782 host target gene. LOC150299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150299 BINDING SITE, designated SEQ ID:41182, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59590] Another function of VGAM1782 is therefore inhibition of LOC150299 (Accession XM\_097869). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150299. LOC220538 (Accession XM\_165407) is another VGAM1782 host target gene. LOC220538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220538 BINDING SITE, designated SEQ ID:43626, to the nucleotide sequence of VGAM1782 RNA, herein designated VGAM RNA, also designated SEQ ID:4493.

[59591] Another function of VGAM1782 is therefore inhibition of LOC220538 (Accession XM\_165407). Accordingly, utilities of VGAM1782 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1783 (VGAM1783) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59592] VGAM1783 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1783 was detected is described hereinabove with reference to Figs. 1–8.

[59593] VGAM1783 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59594] VGAM1783 gene encodes a VGAM1783 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1783 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1783 precursor RNA is designated SEQ ID:1769, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1769 is located at position 33506 relative to the genome of Fowlpox Virus.

[59595] VGAM1783 precursor RNA folds onto itself, forming VGAM1783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59596] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1783 folded precursor RNA into VGAM1783 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1783 RNA is designated SEQ ID:4494, and is provided hereinbelow with reference to the sequence listing part.

[59597] VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1783 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59598] VGAM1783 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1783 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1783 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59599] The complementary binding of VGAM1783 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1783 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1783 host target RNA into VGAM1783 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59600] It is appreciated that VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1783 host target genes. The mRNA of each one of this plurality of VGAM1783 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1783 RNA, herein designated VGAM RNA, and which when bound by VGAM1783 RNA causes inhibition of translation of respective one or more VGAM1783 host target proteins.

[59601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1783 gene, herein designated VGAM GENE, on one or more VGAM1783 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59602] It is yet further appreciated that a function of VGAM1783 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1783 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1783 correlate with, and may be deduced from, the identity of the host target genes which VGAM1783 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59603] Nucleotide sequences of the VGAM1783 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1783 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1783 are further described hereinbelow with reference to Table 1.

[59604] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1783 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1783 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59605] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1783 gene, herein designated VGAM is inhibition of expression of VGAM1783 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1783 correlate with, and may be deduced from, the identity of the target genes which VGAM1783 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59606] Transmembrane 7 Superfamily Member 1 (upregulated in kidney) (TM7SF1, Accession NM\_003272) is a VGAM1783 host target gene. TM7SF1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by TM7SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM7SF1 BINDING SITE, designated SEQ ID:9286, to the nucleotide sequence of VGAM1783 RNA, herein designated VGAM RNA, also designated SEQ ID:4494.

[59607] A function of VGAM1783 is therefore inhibition of Transmembrane 7 Superfamily Member 1 (upregulated in kidney) (TM7SF1, Accession NM\_003272). Accordingly, utilities of VGAM1783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM7SF1. ANKT (Accession NM\_016359) is another VGAM1783 host target gene. ANKT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKT BINDING SITE, designated SEQ ID:18499, to the nucleotide sequence of VGAM1783 RNA, herein designated VGAM RNA, also designated SEQ ID:4494.

[59608] Another function of VGAM1783 is therefore inhibition of ANKT (Accession NM\_016359). Accordingly, utilities of VGAM1783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKT. LOC153077 (Accession XM\_098307) is another VGAM1783 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:41567, to the nucleotide sequence of VGAM1783 RNA, herein designated VGAM RNA, also designated SEQ ID:4494.

[59609] Another function of VGAM1783 is therefore inhibition of LOC153077 (Accession XM\_098307). Accordingly, utilities of VGAM1783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC91286 (Accession XM\_037444) is another VGAM1783 host target gene. LOC91286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91286, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91286 BINDING SITE, designated SEQ ID:32620, to the nucleotide sequence of VGAM1783 RNA, herein designated VGAM RNA, also designated SEQ ID:4494.

[59610] Another function of VGAM1783 is therefore inhibition of LOC91286 (Accession XM\_037444). Accordingly, utilities of VGAM1783 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1784 (VGAM1784) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59611] VGAM1784 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1784 was detected is described hereinabove with reference to Figs. 1-8.

[59612] VGAM1784 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1784 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[59613] VGAM1784 gene encodes a VGAM1784 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1784 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1784 precursor RNA is designated SEQ ID:1770, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1770 is located at position 43278 relative to the genome of Fowlpox Virus.

[59614] VGAM1784 precursor RNA folds onto itself, forming VGAM1784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59615] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1784 folded precursor RNA into VGAM1784

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1784 RNA is designated SEQ ID:4495, and is provided hereinbelow with reference to the sequence listing part.

[59616] VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1784 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59617] VGAM1784 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1784 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1784 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59618] The complementary binding of VGAM1784 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1784 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1784 host target RNA into VGAM1784 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[59619] It is appreciated that VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1784 host target genes. The mRNA of each one of this plurality of VGAM1784 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1784 RNA, herein designated VGAM RNA, and which when bound by VGAM1784 RNA causes inhibition of translation of respective one or more VGAM1784 host target proteins.

[59620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1784 gene, herein designated VGAM GENE, on one or more VGAM1784 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59621] It is yet further appreciated that a function of VGAM1784 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1784 correlate with, and may be deduced from, the identity of the host target genes which VGAM1784 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59622] Nucleotide sequences of the VGAM1784 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1784 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1784 are further described hereinbelow with reference to Table 1.

[59623] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1784 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1784 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59624] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1784 gene, herein designated VGAM is inhibition of expression of VGAM1784 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1784 correlate with, and may be deduced from, the identity of the target genes which VGAM1784 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59625] Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM\_016557) is a VGAM1784 host target gene. CCRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCRL1 BINDING SITE, designated SEQ ID:18631, to the nucleotide sequence of VGAM1784 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4495.

[59626] A function of VGAM1784 is therefore inhibition of Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM\_016557), a gene which is a G protein-coupled receptor that binds chemokines of the CC subfamily, especially MCP-4, ELC (SCYA19) and TECK (SCYA25). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRL1. The function of CCRL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM546. Oxytocin Receptor (OXTR, Accession NM\_000916) is another VGAM1784 host target gene. OXTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OXTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE, designated SEQ ID:6618, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59627] Another function of VGAM1784 is therefore inhibition of Oxytocin Receptor (OXTR, Accession NM\_000916), a gene

which induces inward ion currents. Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR. The function of OXTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM636.FLJ10702 (Accession NM\_018184) is another VGAM1784 host target gene. FLJ10702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10702 BINDING SITE, designated SEQ ID:20025, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59628] Another function of VGAM1784 is therefore inhibition of FLJ10702 (Accession NM\_018184). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10702. KIAA1013 (Accession XM\_114303) is another VGAM1784 host target gene. KIAA1013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1013 BINDING SITE, designated SEQ ID:42856, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59629] Another function of VGAM1784 is therefore inhibition of KIAA1013 (Accession XM\_114303). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1013. SRY (sex determining region Y)-box 7 (SOX7, Accession NM\_031439) is another VGAM1784 host target gene. SOX7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX7 BINDING SITE, designated SEQ ID:25451, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59630] Another function of VGAM1784 is therefore inhibition of SRY (sex determining region Y)-box 7 (SOX7, Accession

NM\_031439). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX7. LOC115297 (Accession XM\_053313) is another VGAM1784 host target gene. LOC115297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115297 BINDING SITE, designated SEQ ID:36069, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59631] Another function of VGAM1784 is therefore inhibition of LOC115297 (Accession XM\_053313). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115297. LOC221288 (Accession XM\_168058) is another VGAM1784 host target gene. LOC221288 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221288 BINDING SITE, designated SEQ ID:44966, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59632] Another function of VGAM1784 is therefore inhibition of LOC221288 (Accession XM\_168058). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221288. LOC90643 (Accession XM\_033145) is another VGAM1784 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90643 BINDING SITE, designated SEQ ID:31849, to the nucleotide sequence of VGAM1784 RNA, herein designated VGAM RNA, also designated SEQ ID:4495.

[59633] Another function of VGAM1784 is therefore inhibition of LOC90643 (Accession XM\_033145). Accordingly, utilities of VGAM1784 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1785 (VGAM1785) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59634] VGAM1785 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1785 was detected is described hereinabove with reference to Figs. 1–8.

[59635] VGAM1785 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59636] VGAM1785 gene encodes a VGAM1785 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1785 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1785 precursor RNA is designated SEQ ID:1771, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1771 is located at position 36138 relative to the genome of Fowlpox Virus.

[59637] VGAM1785 precursor RNA folds onto itself, forming VGAM1785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59638] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1785 folded precursor RNA into VGAM1785 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1785 RNA is designated SEQ ID:4496, and is provided hereinbelow with reference to the sequence listing part.

[59639] VGAM1785 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1785 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59640] VGAM1785 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1785 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1785 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1785 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[59641] The complementary binding of VGAM1785 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1785 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1785 host target RNA into VGAM1785 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59642] It is appreciated that VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1785 host target genes. The mRNA of each one of this plurality of VGAM1785 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1785 RNA, herein designated VGAM RNA, and which when bound by VGAM1785 RNA causes inhibition of translation of respective one or more

VGAM1785 host target proteins.

[59643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1785 gene, herein designated VGAM GENE, on one or more VGAM1785 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59644] It is yet further appreciated that a function of VGAM1785 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1785 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific

functions, and accordingly utilities, of VGAM1785 correlate with, and may be deduced from, the identity of the host target genes which VGAM1785 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59645] Nucleotide sequences of the VGAM1785 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1785 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1785 are further described hereinbelow with reference to Table 1.

[59646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1785 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1785 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59647] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1785 gene, herein designated VGAM is inhibition of expression of VGAM1785 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1785 correlate with, and may be deduced from, the identity of the target genes which VGAM1785 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59648] ARP2 Actin-related Protein 2 Homolog (yeast) (ACTR2, Accession NM\_005722) is a VGAM1785 host target gene. ACTR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR2 BINDING SITE, designated SEQ ID:12274, to the nucleotide sequence of VGAM1785 RNA, herein designated VGAM RNA, also designated SEQ ID:4496.

[59649] A function of VGAM1785 is therefore inhibition of ARP2 Actin-related Protein 2 Homolog (yeast) (ACTR2, Accession NM\_005722). Accordingly, utilities of VGAM1785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR2. FLJ20189 (Accession NM\_017704) is another VGAM1785 host target gene. FLJ20189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by FLJ20189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20189 BINDING SITE, designated SEQ ID:19279, to the nucleotide sequence of VGAM1785 RNA, herein designated VGAM RNA, also designated SEQ ID:4496.

[59650] Another function of VGAM1785 is therefore inhibition of FLJ20189 (Accession NM\_017704). Accordingly, utilities of VGAM1785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20189. My015 (Accession XM\_039512) is another VGAM1785 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33107, to the nucleotide sequence of VGAM1785 RNA, herein designated VGAM RNA, also designated SEQ ID:4496.

[59651] Another function of VGAM1785 is therefore inhibition of My015 (Accession XM\_039512). Accordingly, utilities of

VGAM1785 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1786 (VGAM1786) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59652] VGAM1786 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1786 was detected is described hereinabove with reference to Figs. 1–8.

[59653] VGAM1786 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59654] VGAM1786 gene encodes a VGAM1786 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1786 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1786 precursor RNA is desig-

nated SEQ ID:1772, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1772 is located at position 36018 relative to the genome of Fowlpox Virus.

- [59655] VGAM1786 precursor RNA folds onto itself, forming VGAM1786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [59656] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1786 folded precursor RNA into VGAM1786 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1786 RNA is designated SEQ ID:4497, and is provided hereinbelow with reference to the sequence

listing part.

[59657] VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1786 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59658] VGAM1786 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1786 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1786 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59659] The complementary binding of VGAM1786 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1786 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1786 host target RNA into VGAM1786 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59660] It is appreciated that VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1786 host target genes. The mRNA of each one of this plurality of VGAM1786 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1786 RNA, herein designated VGAM

RNA, and which when bound by VGAM1786 RNA causes inhibition of translation of respective one or more VGAM1786 host target proteins.

[59661] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1786 gene, herein designated VGAM GENE, on one or more VGAM1786 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59662] It is yet further appreciated that a function of VGAM1786 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1786 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1786 correlate with, and may be deduced from, the identity of the host target genes which VGAM1786 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59663] Nucleotide sequences of the VGAM1786 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1786 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1786 are further described hereinbelow with reference to Table 1.

[59664] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1786 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1786 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59665] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1786 gene, herein designated VGAM is

inhibition of expression of VGAM1786 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1786 correlate with, and may be deduced from, the identity of the target genes which VGAM1786 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59666] MGC16175 (Accession NM\_032765) is a VGAM1786 host target gene. MGC16175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16175 BINDING SITE, designated SEQ ID:26513, to the nucleotide sequence of VGAM1786 RNA, herein designated VGAM RNA, also designated SEQ ID:4497.

[59667] A function of VGAM1786 is therefore inhibition of MGC16175 (Accession NM\_032765). Accordingly, utilities of VGAM1786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16175. LOC119548 (Accession XM\_058404) is another VGAM1786 host target gene. LOC119548 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC119548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119548 BINDING SITE, designated SEQ ID:36617, to the nucleotide sequence of VGAM1786 RNA, herein designated VGAM RNA, also designated SEQ ID:4497.

[59668] Another function of VGAM1786 is therefore inhibition of LOC119548 (Accession XM\_058404). Accordingly, utilities of VGAM1786 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119548. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1787 (VGAM1787) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59669] VGAM1787 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1787 was detected is described hereinabove with reference to Figs. 1-8.

[59670] VGAM1787 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowlpox Virus.

VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59671] VGAM1787 gene encodes a VGAM1787 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1787 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1787 precursor RNA is designated SEQ ID:1773, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1773 is located at position 44889 relative to the genome of Fowlpox Virus.

[59672] VGAM1787 precursor RNA folds onto itself, forming VGAM1787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59673] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1787 folded precursor RNA into VGAM1787 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1787 RNA is designated SEQ ID:4498, and is provided hereinbelow with reference to the sequence listing part.

[59674] VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1787 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59675] VGAM1787 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1787 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1787 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59676] The complementary binding of VGAM1787 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1787 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1787

host target RNA into VGAM1787 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59677] It is appreciated that VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1787 host target genes. The mRNA of each one of this plurality of VGAM1787 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1787 RNA, herein designated VGAM RNA, and which when bound by VGAM1787 RNA causes inhibition of translation of respective one or more VGAM1787 host target proteins.

[59678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1787 gene, herein designated VGAM GENE, on one or more VGAM1787 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59679] It is yet further appreciated that a function of VGAM1787 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1787 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1787 correlate with, and may be deduced from, the identity of the host target genes which VGAM1787 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59680] Nucleotide sequences of the VGAM1787 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1787 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1787 are further

described hereinbelow with reference to Table 1.

[59681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1787 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1787 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59682] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1787 gene, herein designated VGAM is inhibition of expression of VGAM1787 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1787 correlate with, and may be deduced from, the identity of the target genes which VGAM1787 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59683] BLAME (Accession NM\_020125) is a VGAM1787 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ

ID:21304, to the nucleotide sequence of VGAM1787 RNA, herein designated VGAM RNA, also designated SEQ ID:4498.

[59684] A function of VGAM1787 is therefore inhibition of BLAME (Accession NM\_020125). Accordingly, utilities of VGAM1787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. RNA Binding Motif Protein 3 (RBM3, Accession XM\_047024) is another VGAM1787 host target gene. RBM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM3 BINDING SITE, designated SEQ ID:34895, to the nucleotide sequence of VGAM1787 RNA, herein designated VGAM RNA, also designated SEQ ID:4498.

[59685] Another function of VGAM1787 is therefore inhibition of RNA Binding Motif Protein 3 (RBM3, Accession XM\_047024). Accordingly, utilities of VGAM1787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM3. LOC152002 (Accession XM\_087360) is another VGAM1787 host target

gene. LOC152002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152002 BINDING SITE, designated SEQ ID:39193, to the nucleotide sequence of VGAM1787 RNA, herein designated VGAM RNA, also designated SEQ ID:4498.

[59686] Another function of VGAM1787 is therefore inhibition of LOC152002 (Accession XM\_087360). Accordingly, utilities of VGAM1787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152002. LOC92979 (Accession NM\_138396) is another VGAM1787 host target gene. LOC92979 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92979 BINDING SITE, designated SEQ ID:28763, to the nucleotide sequence of VGAM1787 RNA, herein designated VGAM RNA, also designated SEQ ID:4498.

[59687] Another function of VGAM1787 is therefore inhibition of LOC92979 (Accession NM\_138396). Accordingly, utilities of VGAM1787 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1788 (VGAM1788) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59688] VGAM1788 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1788 was detected is described hereinabove with reference to Figs. 1–8.

[59689] VGAM1788 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59690] VGAM1788 gene encodes a VGAM1788 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1788 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1788 precursor RNA is designated SEQ ID:1774, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1774 is located at position 45071 relative to the genome of Fowlpox Virus.

[59691] VGAM1788 precursor RNA folds onto itself, forming VGAM1788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59692] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1788 folded precursor RNA into VGAM1788 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1788 RNA is designated SEQ ID:4499, and is provided hereinbelow with reference to the sequence listing part.

[59693] VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1788 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[59694] VGAM1788 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1788 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1788 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59695] The complementary binding of VGAM1788 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1788 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1788 host target RNA into VGAM1788 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59696] It is appreciated that VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1788 host target genes. The mRNA of each one of this plurality of VGAM1788 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1788 RNA, herein designated VGAM RNA, and which when bound by VGAM1788 RNA causes inhibition of translation of respective one or more VGAM1788 host target proteins.

[59697] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1788 gene, herein designated VGAM GENE, on one or more VGAM1788 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59698] It is yet further appreciated that a function of VGAM1788 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1788 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1788 correlate with, and may be deduced from, the identity of the host target genes which VGAM1788 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59699] Nucleotide sequences of the VGAM1788 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1788 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1788 are further described hereinbelow with reference to Table 1.

[59700] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1788 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1788 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[59701] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1788 gene, herein designated VGAM is inhibition of expression of VGAM1788 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1788 correlate with, and may be deduced from, the identity of the target genes which VGAM1788 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59702] CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838) is a VGAM1788 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36196, to the nucleotide sequence of VGAM1788 RNA, herein designated VGAM RNA, also designated SEQ ID:4499.

[59703] A function of VGAM1788 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838). Accordingly, utilities of VGAM1788 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with CSMD1. PRO2389 (Accession XM\_033334) is another VGAM1788 host target gene. PRO2389 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2389 BINDING SITE, designated SEQ ID:31881, to the nucleotide sequence of VGAM1788 RNA, herein designated VGAM RNA, also designated SEQ ID:4499.

[59704] Another function of VGAM1788 is therefore inhibition of PRO2389 (Accession XM\_033334). Accordingly, utilities of VGAM1788 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2389. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1789 (VGAM1789) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59705] VGAM1789 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1789 was detected is described hereinabove with reference to Figs. 1–8.

[59706] VGAM1789 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59707] VGAM1789 gene encodes a VGAM1789 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1789 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1789 precursor RNA is designated SEQ ID:1775, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1775 is located at position 42299 relative to the genome of Fowlpox Virus.

[59708] VGAM1789 precursor RNA folds onto itself, forming VGAM1789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59709] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1789 folded precursor RNA into VGAM1789 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1789 RNA is designated SEQ ID:4500, and is provided hereinbelow with reference to the sequence listing part.

[59710] VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1789 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59711] VGAM1789 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1789 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1789 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59712] The complementary binding of VGAM1789 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1789 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1789 host target RNA into VGAM1789 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59713] It is appreciated that VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1789 host target genes. The mRNA of each one of this plurality of VGAM1789 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1789 RNA, herein designated VGAM RNA, and which when bound by VGAM1789 RNA causes inhibition of translation of respective one or more VGAM1789 host target proteins.

[59714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1789 gene, herein designated VGAM GENE, on one or more VGAM1789 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59715] It is yet further appreciated that a function of VGAM1789 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1789 correlate with, and may be deduced from, the identity of the host target genes which VGAM1789 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59716] Nucleotide sequences of the VGAM1789 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1789 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1789 are further described hereinbelow with reference to Table 1.

[59717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1789 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1789 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59718] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1789 gene, herein designated VGAM is inhibition of expression of VGAM1789 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1789 correlate with, and may be deduced from, the identity of the target genes which VGAM1789 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59719] Norrie Disease (pseudoglioma) (NDP, Accession NM\_000266) is a VGAM1789 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5807, to the nucleotide sequence of VGAM1789 RNA, herein designated VGAM RNA, also designated SEQ ID:4500.

[59720] A function of VGAM1789 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM\_000266), a gene which may be involved in a pathway that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113.DKFZp761F2014 (Accession NM\_020215) is another VGAM1789 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21463, to the nucleotide sequence of VGAM1789 RNA, herein designated VGAM RNA, also designated SEQ ID:4500.

[59721] Another function of VGAM1789 is therefore inhibition of DKFZp761F2014 (Accession NM\_020215). Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. FLJ23590 (Accession NM\_024649) is another VGAM1789 host target gene. FLJ23590 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23590 BINDING SITE, designated SEQ ID:23941, to the nucleotide sequence of VGAM1789 RNA, herein designated VGAM RNA, also designated SEQ ID:4500.

[59722] Another function of VGAM1789 is therefore inhibition of FLJ23590 (Accession NM\_024649). Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23590. KIAA0016 (Accession NM\_014765) is another

VGAM1789 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16535, to the nucleotide sequence of VGAM1789 RNA, herein designated VGAM RNA, also designated SEQ ID:4500.

[59723] Another function of VGAM1789 is therefore inhibition of KIAA0016 (Accession NM\_014765). Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. LOC145566 (Accession XM\_085174) is another VGAM1789 host target gene. LOC145566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145566 BINDING SITE, designated SEQ ID:37901, to the nucleotide sequence of VGAM1789 RNA, herein designated VGAM RNA, also designated SEQ ID:4500.

[59724] Another function of VGAM1789 is therefore inhibition of LOC145566 (Accession XM\_085174). Accordingly, utilities of VGAM1789 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145566. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1790 (VGAM1790) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59725] VGAM1790 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1790 was detected is described hereinabove with reference to Figs. 1–8.

[59726] VGAM1790 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59727] VGAM1790 gene encodes a VGAM1790 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1790 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1790 precursor RNA is designated SEQ ID:1776, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1776 is located at position 79077 relative to the genome of Rana Tigrina Ranavirus.

[59728] VGAM1790 precursor RNA folds onto itself, forming VGAM1790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1790 folded precursor RNA into VGAM1790 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1790 RNA is designated SEQ ID:4501, and is provided hereinbelow with reference to the sequence listing part.

[59730] VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1790 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59731] VGAM1790 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1790 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1790 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59732] The complementary binding of VGAM1790 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1790 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1790 host target RNA into VGAM1790 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59733] It is appreciated that VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1790 host target genes. The mRNA of each one of this plurality of VGAM1790 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1790 RNA, herein designated VGAM RNA, and which when bound by VGAM1790 RNA causes inhibition of translation of respective one or more VGAM1790 host target proteins.

[59734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1790 gene, herein designated VGAM GENE, on one or more VGAM1790 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59735] It is yet further appreciated that a function of VGAM1790 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1790 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1790 correlate with, and may be deduced from, the identity of the host target genes which VGAM1790 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59736] Nucleotide sequences of the VGAM1790 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1790 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1790 are further described hereinbelow with reference to Table 1.

[59737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1790 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1790 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[59738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1790 gene, herein designated VGAM is inhibition of expression of VGAM1790 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1790 correlate with, and may be deduced from, the identity of the target genes which VGAM1790 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59739] Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM\_013261) is a VGAM1790 host target gene. PPARGC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPARGC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPARGC1 BINDING SITE, designated SEQ ID:14931, to the nucleotide sequence of VGAM1790 RNA, herein designated VGAM RNA, also designated SEQ ID:4501.

[59740] A function of VGAM1790 is therefore inhibition of Peroxisome Proliferative Activated Receptor, Gamma, Coactivator 1 (PPARGC1, Accession NM\_013261), a gene which

may play a role in insulin sensitivity and thermogenesis. Accordingly, utilities of VGAM1790 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPARGC1. The function of PPARGC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM952. PRO1575 (Accession NM\_014092) is another VGAM1790 host target gene. PRO1575 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1575, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1575 BINDING SITE, designated SEQ ID:15312, to the nucleotide sequence of VGAM1790 RNA, herein designated VGAM RNA, also designated SEQ ID:4501.

[59741] Another function of VGAM1790 is therefore inhibition of PRO1575 (Accession NM\_014092). Accordingly, utilities of VGAM1790 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1575. LOC90141 (Accession XM\_029373) is another VGAM1790 host target gene. LOC90141 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90141 BINDING SITE, designated SEQ ID:30881, to the nucleotide sequence of VGAM1790 RNA, herein designated VGAM RNA, also designated SEQ ID:4501.

[59742] Another function of VGAM1790 is therefore inhibition of LOC90141 (Accession XM\_029373). Accordingly, utilities of VGAM1790 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90141. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1791 (VGAM1791) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59743] VGAM1791 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1791 was detected is described hereinabove with reference to Figs. 1-8.

[59744] VGAM1791 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59745] VGAM1791 gene encodes a VGAM1791 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1791 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1791 precursor RNA is designated SEQ ID:1777, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1777 is located at position 85010 relative to the genome of Rana Tigrina Ranavirus.

[59746] VGAM1791 precursor RNA folds onto itself, forming VGAM1791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[59747] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1791 folded precursor RNA into VGAM1791 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1791 RNA is designated SEQ ID:4502, and is provided hereinbelow with reference to the sequence listing part.

[59748] VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1791 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59749] VGAM1791 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1791 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1791 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1791 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59750] The complementary binding of VGAM1791 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1791 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1791 host target RNA into VGAM1791 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59751] It is appreciated that VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1791 host target genes. The mRNA of each one of this plurality of VGAM1791 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1791 RNA, herein designated VGAM RNA, and which when bound by VGAM1791 RNA causes inhibition of translation of respective one or more VGAM1791 host target proteins.

[59752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1791 gene, herein designated VGAM GENE, on one or more VGAM1791 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59753] It is yet further appreciated that a function of VGAM1791 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1791 correlate with, and may be deduced from, the identity of the host target genes which VGAM1791 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59754] Nucleotide sequences of the VGAM1791 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1791 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1791 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1791 are further described hereinbelow with reference to Table 1.

[59755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1791 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1791 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59756] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1791 gene, herein designated VGAM is inhibition of expression of VGAM1791 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1791 correlate with, and may be deduced from, the identity of the target genes which VGAM1791 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59757] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM\_033171) is a VGAM1791 host target gene. B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT5, corresponding to HOST TARGET binding

sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE4, designated SEQ ID:27026, SEQ ID:27036, SEQ ID:27031 and SEQ ID:12698 respectively, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59758] A function of VGAM1791 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM\_033171). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009) is another VGAM1791 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23437, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59759] Another function of VGAM1791 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943) is another VGAM1791 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38408, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59760] Another function of VGAM1791 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.MAX Binding Protein (MNT, Accession NM\_020310) is another VGAM1791 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21565, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59761] Another function of VGAM1791 is therefore inhibition of MAX Binding Protein (MNT, Accession NM\_020310). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Metastasis-associated 1-like 1 (MTA1L1, Accession NM\_004739) is another VGAM1791 host target gene. MTA1L1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MTA1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MTA1L1 BINDING SITE, designated SEQ ID:11136, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59762] Another function of VGAM1791 is therefore inhibition of Metastasis-associated 1-like 1 (MTA1L1, Accession NM\_004739), a gene which regulates histone deacetylase core complex enzymatic activity. Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTA1L1. The function of MTA1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659. Promyelocytic Leukemia (PML, Accession NM\_033240) is another VGAM1791 host target gene. PML BINDING SITE1 and PML BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PML, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE1 and PML BINDING SITE2, designated SEQ ID:27079 and SEQ ID:27083 respectively, to the nucleotide sequence of

VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59763] Another function of VGAM1791 is therefore inhibition of Promyelocytic Leukemia (PML, Accession NM\_033240). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PML. Chromosome 20 Open Reading Frame 112 (C20orf112, Accession NM\_080616) is another VGAM1791 host target gene. C20orf112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf112 BINDING SITE, designated SEQ ID:27931, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59764] Another function of VGAM1791 is therefore inhibition of Chromosome 20 Open Reading Frame 112 (C20orf112, Accession NM\_080616). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf112. FLJ12488 (Accession NM\_031218) is another

VGAM1791 host target gene. FLJ12488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12488 BINDING SITE, designated SEQ ID:25264, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59765] Another function of VGAM1791 is therefore inhibition of FLJ12488 (Accession NM\_031218). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12488. FLJ23392 (Accession NM\_024784) is another VGAM1791 host target gene. FLJ23392 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23392 BINDING SITE, designated SEQ ID:24159, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59766] Another function of VGAM1791 is therefore inhibition of FLJ23392 (Accession NM\_024784). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23392. KIAA0153 (Accession NM\_015140) is another VGAM1791 host target gene. KIAA0153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0153 BINDING SITE, designated SEQ ID:17495, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59767] Another function of VGAM1791 is therefore inhibition of KIAA0153 (Accession NM\_015140). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0153. KIAA0555 (Accession NM\_014790) is another VGAM1791 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:16678, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59768] Another function of VGAM1791 is therefore inhibition of KIAA0555 (Accession NM\_014790). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. KIAA1204 (Accession XM\_045011) is another VGAM1791 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34313, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59769] Another function of VGAM1791 is therefore inhibition of KIAA1204 (Accession XM\_045011). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1204. KIAA1755 (Accession XM\_028810) is another VGAM1791 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30746, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59770] Another function of VGAM1791 is therefore inhibition of KIAA1755 (Accession XM\_028810). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. KIAA1908 (Accession XM\_055834) is another VGAM1791 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36330, to the nucleotide sequence of VGAM1791 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4502.

[59771] Another function of VGAM1791 is therefore inhibition of KIAA1908 (Accession XM\_055834). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702) is another VGAM1791 host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:34264, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59772] Another function of VGAM1791 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10. TOLLIP (Accession NM\_019009) is another VGAM1791 host target gene. TOLLIP BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by TOLLIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOLLIP BINDING SITE, designated SEQ ID:21090, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59773] Another function of VGAM1791 is therefore inhibition of TOLLIP (Accession NM\_019009). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOLLIP. LOC143451 (Accession XM\_084521) is another VGAM1791 host target gene. LOC143451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143451 BINDING SITE, designated SEQ ID:37620, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59774] Another function of VGAM1791 is therefore inhibition of

LOC143451 (Accession XM\_084521). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143451. LOC145125 (Accession XM\_085025) is another VGAM1791 host target gene. LOC145125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145125 BINDING SITE, designated SEQ ID:37797, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59775] Another function of VGAM1791 is therefore inhibition of LOC145125 (Accession XM\_085025). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145125. LOC147495 (Accession XM\_097240) is another VGAM1791 host target gene. LOC147495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147495 BINDING SITE, designated SEQ ID:40839, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59776] Another function of VGAM1791 is therefore inhibition of LOC147495 (Accession XM\_097240). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147495. LOC158158 (Accession XM\_088494) is another VGAM1791 host target gene. LOC158158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158158 BINDING SITE, designated SEQ ID:39733, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59777] Another function of VGAM1791 is therefore inhibition of LOC158158 (Accession XM\_088494). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158158. LOC254440 (Accession XM\_173126) is an-

other VGAM1791 host target gene. LOC254440 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254440 BINDING SITE, designated SEQ ID:46374, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59778] Another function of VGAM1791 is therefore inhibition of LOC254440 (Accession XM\_173126). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254440. LOC256310 (Accession XM\_172813) is another VGAM1791 host target gene. LOC256310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256310 BINDING SITE, designated SEQ ID:46092, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59779] Another function of VGAM1791 is therefore inhibition of LOC256310 (Accession XM\_172813). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256310. LOC93356 (Accession XM\_050744) is another VGAM1791 host target gene. LOC93356 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93356 BINDING SITE, designated SEQ ID:35671, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59780] Another function of VGAM1791 is therefore inhibition of LOC93356 (Accession XM\_050744). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93356. LOC93496 (Accession XM\_051698) is another VGAM1791 host target gene. LOC93496 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93496, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93496 BINDING SITE, designated SEQ ID:35865, to the nucleotide sequence of VGAM1791 RNA, herein designated VGAM RNA, also designated SEQ ID:4502.

[59781] Another function of VGAM1791 is therefore inhibition of LOC93496 (Accession XM\_051698). Accordingly, utilities of VGAM1791 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93496. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1792 (VGAM1792) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59782] VGAM1792 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1792 was detected is described hereinabove with reference to Figs. 1-8.

[59783] VGAM1792 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1792 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[59784] VGAM1792 gene encodes a VGAM1792 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1792 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1792 precursor RNA is designated SEQ ID:1778, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1778 is located at position 75405 relative to the genome of Rana Tigrina Ranavirus.

[59785] VGAM1792 precursor RNA folds onto itself, forming VGAM1792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59786] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1792 folded precursor RNA into VGAM1792

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1792 RNA is designated SEQ ID:4503, and is provided hereinbelow with reference to the sequence listing part.

[59787] VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1792 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59788] VGAM1792 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1792 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1792 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59789] The complementary binding of VGAM1792 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1792 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1792 host target RNA into VGAM1792 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[59790] It is appreciated that VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1792 host target genes. The mRNA of each one of this plurality of VGAM1792 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1792 RNA, herein designated VGAM RNA, and which when bound by VGAM1792 RNA causes inhibition of translation of respective one or more VGAM1792 host target proteins.

[59791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1792 gene, herein designated VGAM GENE, on one or more VGAM1792 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59792] It is yet further appreciated that a function of VGAM1792 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1792 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1792 correlate with, and may be deduced from, the identity of the host target genes which VGAM1792 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59793] Nucleotide sequences of the VGAM1792 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1792 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1792 are further described hereinbelow with reference to Table 1.

[59794] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1792 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1792 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59795] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1792 gene, herein designated VGAM is inhibition of expression of VGAM1792 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1792 correlate with, and may be deduced from, the identity of the target genes which VGAM1792 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59796] Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM\_002474) is a VGAM1792 host target gene. MYH11 BINDING SITE1 and MYH11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MYH11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH11 BINDING SITE1 and MYH11 BINDING SITE2, designated SEQ ID:8300

and SEQ ID:23142 respectively, to the nucleotide sequence of VGAM1792 RNA, herein designated VGAM RNA, also designated SEQ ID:4503.

[59797] A function of VGAM1792 is therefore inhibition of Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM\_002474), a gene which is involved in muscle contraction. Accordingly, utilities of VGAM1792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH11. The function of MYH11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549) is another VGAM1792 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13316, to the nucleotide sequence of VGAM1792 RNA, herein designated VGAM RNA, also designated SEQ ID:4503.

[59798] Another function of VGAM1792 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549). Accordingly, utilities of VGAM1792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. FLJ32894 (Accession NM\_144667) is another VGAM1792 host target gene. FLJ32894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32894 BINDING SITE, designated SEQ ID:29485, to the nucleotide sequence of VGAM1792 RNA, herein designated VGAM RNA, also designated SEQ ID:4503.

[59799] Another function of VGAM1792 is therefore inhibition of FLJ32894 (Accession NM\_144667). Accordingly, utilities of VGAM1792 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32894. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1793 (VGAM1793) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59800] VGAM1793 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1793 was detected is described hereinabove with reference to Figs. 1–8.

[59801] VGAM1793 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59802] VGAM1793 gene encodes a VGAM1793 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1793 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1793 precursor RNA is designated SEQ ID:1779, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1779 is located at position 85120 relative to the genome of Rana Tigrina Ranavirus.

[59803] VGAM1793 precursor RNA folds onto itself, forming

VGAM1793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59804] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1793 folded precursor RNA into VGAM1793 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1793 RNA is designated SEQ ID:4504, and is provided hereinbelow with reference to the sequence listing part.

[59805] VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1793 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59806] VGAM1793 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1793 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1793 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59807] The complementary binding of VGAM1793 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1793 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1793 host target RNA into VGAM1793 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59808] It is appreciated that VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1793 host target genes. The mRNA of each one of this plurality of VGAM1793 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1793 RNA, herein designated VGAM RNA, and which when bound by VGAM1793 RNA causes inhibition of translation of respective one or more VGAM1793 host target proteins.

[59809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1793 gene, herein designated VGAM GENE, on one or more VGAM1793 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59810] It is yet further appreciated that a function of VGAM1793 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1793 correlate with, and may be deduced from, the identity of the host target genes which VGAM1793 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[59811] Nucleotide sequences of the VGAM1793 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1793 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1793 are further described hereinbelow with reference to Table 1.

[59812] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1793 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1793 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59813] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1793 gene, herein designated VGAM is inhibition of expression of VGAM1793 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1793 correlate with, and may be deduced from, the identity of the target genes which VGAM1793 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[59814] Amphiregulin (schwannoma-derived growth factor) (AREG, Accession NM\_001657) is a VGAM1793 host target gene. AREG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AREG BINDING SITE, designated SEQ ID:7376, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59815] A function of VGAM1793 is therefore inhibition of Amphiregulin (schwannoma-derived growth factor) (AREG, Accession NM\_001657), a gene which inhibits the growth of certain carcinoma cell lines but stimulates the growth of fibroblasts and epithelial cells. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AREG. The function of AREG has been established by previous studies. To identify new growth factors important to the development of the nervous system, Kimura et al. (1990) screened serum-free growth-conditioned media from many clonal cell lines for the presence of mitogens for

CNS glial cells. A cell line secreting a potent glial mitogen was established from a schwannoma of the sciatic nerve. The cells of the tumor, named JS1 cells, were adapted to clonal culture and identified as Schwann cells. Schwann cells secrete an autocrine mitogen and human schwannoma extracts have mitogenic activity on glial cells.

Kimura et al. (1990) reported the purification and characterization of the mitogenic molecule, designated schwannoma-derived growth factor (SDGF), from the growth-conditioned medium of the JS1 Schwann cell line. SDGF belongs to the epidermal growth factor family and is an autocrine growth factor as well as a mitogen for astrocytes, Schwann cells, and fibroblasts. Amphiregulin is a heparin-binding, heparin-inhibited member of the epidermal growth factor family and an autocrine growth factor for human keratinocytes. AREG expression is increased in psoriatic epidermis. To test the hypothesis that aberrant AREG expression is central to the development of psoriatic lesions, Cook et al. (1997) constructed a transgene encoding the human AREG gene driven by the promoter of human keratin 14 (OMIM Ref. No. 148066). They found that transgene integration and subsequent expression of AREG in basal keratinocytes correlated with a pso-

riasis-like skin phenotype. Afflicted mice demonstrated shortened life spans, prominent scaling and erythematous skin with alopecia, and occasional papillomatous epidermal growths. Histologic examination revealed extensive areas of marked hyperkeratosis with focal parakeratosis, acanthosis, dermal and epidermal lymphocytic and neutrophilic infiltration, and dilated blood vessels within the papillary dermis. The skin pathology was considered to be strikingly similar to psoriasis. The observations of Cook et al. (1997) linked the keratinocyte EGF receptor-ligand system to psoriatic inflammation and suggested that aberrant expression of AREG in the epidermis may represent a critical step in the development or propagation of psoriatic lesions.

[59816] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59817] Cook, P. W.; Piepkorn, M.; Clegg, C. H.; Plowman, G. D.; DeMay, J. M.; Brown, J. R.; Pittelkow, M. R. : Transgenic expression of the human amphiregulin gene induces a psoriasis-like phenotype. J. Clin. Invest. 100: 2286-2294, 1997. ; and

[59818] Kimura, H.; Fischer, W. H.; Schubert, D. : Structure, ex-

pression and function of a schwannoma-derived growth factor. Nature 348: 257-260, 1990.

[59819] Further studies establishing the function and utilities of AREG are found in John Hopkins OMIM database record ID 104640, and in cited publications numbered 12266-12268, 26 and 12414-12415 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174) is another VGAM1793 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6843, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59820] Another function of VGAM1793 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM\_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM1793 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM55.Calmodulin 3 (phosphorylase kinase, delta) (CALM3, Accession NM\_005184) is another VGAM1793 host target gene. CALM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALM3 BINDING SITE, designated SEQ ID:11684, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59821] Another function of VGAM1793 is therefore inhibition of Calmodulin 3 (phosphorylase kinase, delta) (CALM3, Accession NM\_005184), a gene which mediates the control of a large number of enzymes by  $Ca^{++}$ . Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALM3. The function of CALM3 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM785. DnaJ (Hsp40) Homolog, Subfamily B, Member 9 (DNAJB9, Accession NM\_012328) is another VGAM1793 host target gene. DNAJB9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNAJB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB9 BINDING SITE, designated SEQ ID:14718, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59822] Another function of VGAM1793 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily B, Member 9 (DNAJB9, Accession NM\_012328). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB9. EphA8 (EPHA8, Accession NM\_020526) is another VGAM1793 host target gene. EPHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA8 BINDING SITE, designated SEQ ID:21746, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59823] Another function of VGAM1793 is therefore inhibition of EphA8 (EPHA8, Accession NM\_020526), a gene which Eph-related receptor tyrosine kinase A8. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA8. The function of EPHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494. Ellis Van Creveld Syndrome (EVC, Accession NM\_014556) is another VGAM1793 host target gene. EVC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15882, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ

ID:4504.

[59824] Another function of VGAM1793 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM\_014556). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM\_009220) is another VGAM1793 host target gene. GNA15 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:30103, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59825] Another function of VGAM1793 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM\_009220). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15. 5-hydroxytryptamine (serotonin) Receptor

1D (HTR1D, Accession NM\_000864) is another VGAM1793 host target gene. HTR1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR1D BINDING SITE, designated SEQ ID:6530, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59826] Another function of VGAM1793 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 1D (HTR1D, Accession NM\_000864), a gene which belongs to G-protein coupled receptor. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR1D. The function of HTR1D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Immediate Early Response 3 (IER3, Accession NM\_003897) is another VGAM1793 host target gene. IER3 BINDING SITE1 and IER3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by IER3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IER3 BINDING SITE1 and IER3 BINDING SITE2, designated SEQ ID:9980 and SEQ ID:27400 respectively, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59827] Another function of VGAM1793 is therefore inhibition of Immediate Early Response 3 (IER3, Accession NM\_003897), a gene which protects cells from apoptosis induced by FAS or TNFA. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IER3. The function of IER3 has been established by previous studies. Transcription factors of the nuclear factor-kappa-B/rel (NF-kappa-B) family (OMIM Ref. No. 164011) may be important in cell survival by regulating unidentified, anti-apoptotic genes. Charles et al. (1993) cloned gly96, a mouse immediate-early gene inducible by serum growth factors. Schafer et al. (1996) cloned the rat homolog, PRG1, which was induced in response to the pituitary adenylate cyclase-activating polypeptide (PACAP;

102980). Kondratyev et al. (1996) cloned the human immediate-early gene IEX1. The cDNA encodes 156-amino acid polypeptide containing a single predicted transmembrane domain. On Northern blots, they observed a 1.2-kb mRNA whose expression could be induced by ionizing radiation, 12-O-tetradecanoylphorbol-13-acetate (TPA), okadaic acid, and TNF-alpha (OMIM Ref. No. 191160); these agents are all activators of the protein kinase C (PKC; OMIM Ref. No. 176960) pathway. Pietzsch et al. (1997) cloned the same human gene, which they termed DIF2. The expression of the DIF2 mRNA is downregulated during differentiation of macrophages and upregulated by lipopolysaccharide (LPS) stimulation of monocytes. Northern blot analysis revealed that DIF2 is expressed most abundantly in monocytes, lymphocytes, and keratinocytes, and at a lesser level in several other human tissues and cell lines. Wu et al. (1998) described a gene that protects cells from apoptosis induced by FAS (OMIM Ref. No. 134637) or TNFA. The gene appeared to be the same as the immediate-early response gene IEX1 reported by Kondratyev et al. (1996), Charles et al. (1993), and Schafer et al. (1996), except that it had an in-frame insertion of 111 nucleotides at position 211 of the coding region of IEX1,

and could encode a longer polypeptide with a 37-amino acid insertion relative to IEX1. The longer IEX1 (referred to as IEX1L; the original IEX1 was referred to as IEX1S) was found to be generated from IEX1 in the absence of RNA splicing as it contained the entire intron sequence of IEX1. The transcription of IEX1L induced by TNF was decreased in cells with defective NF-kappa-B activation, rendering them sensitive to TNF-induced apoptosis, which was abolished by transfection with IEX1L. In support, overexpression of antisense IEX1L partially blocked TNF-induced expression of IEX1L and sensitized normal cells to killing. This study demonstrated a key role of IEX1L in cellular resistance to TNF-induced apoptosis. Pietzsch et al. (1998) cloned the genomic DNA of the DIF2 gene. They found that the gene consists of 2 exons and a single small intron. The 5-prime flanking region of the gene contains binding sites for transcription factors including NF-kappa-B, CEBP (OMIM Ref. No. 116897), and SP1 (OMIM Ref. No. 189906). Pietzsch et al. (1998) used fluorescence in situ hybridization to map the IER3 gene to human chromosome 6p21.3.

[59828] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [59829] Pietzsch, A.; Buchler, C.; Schmitz, G. : Genomic organization, promoter cloning, and chromosomal localization of the Dif-2 gene. *Biochem. Biophys. Res. Commun.* 245: 651-657, 1998. ; and
- [59830] Wu, M. X.; Ao, Z.; Prasad, K. V. S.; Wu, R.; Schlossman, S. F. : IEX-1L, an apoptosis inhibitor involved in NF-kappa-B-mediated cell survival. *Science* 281: 998-1001, 1998.
- [59831] Further studies establishing the function and utilities of IER3 are found in John Hopkins OMIM database record ID 602996, and in cited publications numbered 5412-5417 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mucin 3B (MUC3B, Accession XM\_168578) is another VGAM1793 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:45253, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ

ID:4504.

[59832] Another function of VGAM1793 is therefore inhibition of Mucin 3B (MUC3B, Accession XM\_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Myosin Light Chain Kinase 2, Skeletal Muscle (MYLK2, Accession NM\_033118) is another VGAM1793 host target gene. MYLK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYLK2 BINDING SITE, designated SEQ ID:26966, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59833] Another function of VGAM1793 is therefore inhibition of Myosin Light Chain Kinase 2, Skeletal Muscle (MYLK2, Ac-

cession NM\_033118). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK2. Myogenin (myogenic factor 4) (MYOG, Accession XM\_001688) is another VGAM1793 host target gene. MYOG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYOG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYOG BINDING SITE, designated SEQ ID:29848, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59834] Another function of VGAM1793 is therefore inhibition of Myogenin (myogenic factor 4) (MYOG, Accession XM\_001688), a gene which can induce myogenesis in a variety of cell types. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYOG. The function of MYOG has been established by previous studies. Studies of the cloned MYF4 indicate limited sequence homology to MYOD1 and MYF5. Hybridization to DNA from a panel of somatic cell hybrids indicated that the MYF4 gene

is located on human chromosome 1 (Braun et al., 1989). By in situ hybridization to human metaphase chromosomes and by segregation analysis in interspecific somatic cell hybrid panels, Olson et al. (1990) assigned the MYOG gene to 1q31–q41 and showed that the corresponding genes in the mouse (Myog) and Chinese hamster (MYOG) mapped to regions of syntenic homology on mouse chromosome 1 and Chinese hamster chromosome 5. Nonlinkage to MYOD1, MYF5, and MYF6 (OMIM Ref. No. 159991) was demonstrated. Animal model experiments lend further support to the function of MYOG. Myogenin is a muscle-specific transcription factor that can induce myogenesis in a variety of cell types in tissue culture. It is a member of the basic helix–loop–helix (bHLH) gene family. To test its role in vivo, Hasty et al. (1993) generated mice homozygous for a targeted mutation in the myogenin gene. These mice survived fetal development but died immediately after birth and showed a severe reduction of all skeletal muscle. Thus, myogenin–mutant mice differed from mice carrying mutations in genes for the related MYF5 (OMIM Ref. No. 159990) and MYF3 (MYOD1; 159970), which have no muscle defects. From these observations, Hasty et al. (1993) concluded that myogenin is

essential for the development of functional skeletal muscle. Nabeshima et al. (1993) independently found similar results and arrived at similar conclusions from 'knockout' experiments in mice.

[59835] It is appreciated that the abovementioned animal model for MYOG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[59836] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59837] Hasty, P.; Bradley, A.; Morris, J. H.; Edmondson, D. G.; Venuti, J. M.; Olson, E. N.; Klein, W. H. : Muscle deficiency and neonatal death in mice with a targeted mutation in the myogenin gene. Nature 364: 501–506, 1993. ; and

[59838] Braun, T.; Grzeschik, K.–H.; Bober, E.; Arnold, H.–H. : The MYF genes, a group of human muscle determining factors, are localized on different human chromosomes. (Abstract) Cytogenet.

[59839] Further studies establishing the function and utilities of MYOG are found in John Hopkins OMIM database record ID 159980, and in cited publications numbered 168 and 11143–1688 listed in the bibliography section hereinbe–

low, which are also hereby incorporated by reference. Neuregulin 1 (NRG1, Accession NM\_004495) is another VGAM1793 host target gene. NRG1 BINDING SITE1 through NRG1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRG1 BINDING SITE1 through NRG1 BINDING SITE4, designated SEQ ID:10834, SEQ ID:15137, SEQ ID:15138 and SEQ ID:15141 respectively, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59840] Another function of VGAM1793 is therefore inhibition of Neuregulin 1 (NRG1, Accession NM\_004495), a gene which is essential for neuronal development. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRG1. The function of NRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1259. Olfactomedin 1 (OLFM1, Accession NM\_006334) is another VGAM1793 host target gene.

OLFM1 BINDING SITE1 through OLFM1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OLFM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM1 BINDING SITE1 through OLFM1 BINDING SITE3, designated SEQ ID:13034, SEQ ID:27761 and SEQ ID:7497 respectively, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59841] Another function of VGAM1793 is therefore inhibition of Olfactomedin 1 (OLFM1, Accession NM\_006334). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM1. SNL (Accession NM\_003088) is another VGAM1793 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9060, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4504.

[59842] Another function of VGAM1793 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675. APEG1 (Accession XM\_050966) is another VGAM1793 host target gene. APEG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APEG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APEG1 BINDING SITE, designated SEQ ID:35693, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59843] Another function of VGAM1793 is therefore inhibition of APEG1 (Accession XM\_050966). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with APEG1. Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803) is another VGAM1793 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE, designated SEQ ID:38879, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59844] Another function of VGAM1793 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM\_086803). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7. Complexin 1 (CPLX1, Accession NM\_006651) is another VGAM1793 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:13449, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59845] Another function of VGAM1793 is therefore inhibition of Complexin 1 (CPLX1, Accession NM\_006651). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. DKFZP434B205 (Accession XM\_059966) is another VGAM1793 host target gene. DKFZP434B205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B205 BINDING SITE, designated SEQ ID:37125, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59846] Another function of VGAM1793 is therefore inhibition of DKFZP434B205 (Accession XM\_059966). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434B205. DKFZP586J1624 (Accession NM\_015537) is another VGAM1793 host target gene. DKFZP586J1624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586J1624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586J1624 BINDING SITE, designated SEQ ID:17799, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59847] Another function of VGAM1793 is therefore inhibition of DKFZP586J1624 (Accession NM\_015537). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586J1624. FLJ10342 (Accession NM\_018064) is another VGAM1793 host target gene. FLJ10342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10342 BINDING SITE, designated SEQ ID:19835, to the

nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59848] Another function of VGAM1793 is therefore inhibition of FLJ10342 (Accession NM\_018064). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10342. FLJ10759 (Accession NM\_018207) is another VGAM1793 host target gene. FLJ10759 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10759 BINDING SITE, designated SEQ ID:20101, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59849] Another function of VGAM1793 is therefore inhibition of FLJ10759 (Accession NM\_018207). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10759. FLJ13052 (Accession NM\_023018) is another VGAM1793 host target gene. FLJ13052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ13052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13052 BINDING SITE, designated SEQ ID:23283, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59850] Another function of VGAM1793 is therefore inhibition of FLJ13052 (Accession NM\_023018). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13052. FLJ23511 (Accession NM\_032239) is another VGAM1793 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25967, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59851] Another function of VGAM1793 is therefore inhibition of FLJ23511 (Accession NM\_032239). Accordingly, utilities of

VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. HSPC154 (Accession NM\_014177) is another VGAM1793 host target gene. HSPC154 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSPC154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC154 BINDING SITE, designated SEQ ID:15463, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59852] Another function of VGAM1793 is therefore inhibition of HSPC154 (Accession NM\_014177). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC154. HSU79274 (Accession NM\_013300) is another VGAM1793 host target gene. HSU79274 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HSU79274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

HSU79274 BINDING SITE, designated SEQ ID:14959, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59853] Another function of VGAM1793 is therefore inhibition of HSU79274 (Accession NM\_013300). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSU79274. KIAA0217 (Accession XM\_040265) is another VGAM1793 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33280, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59854] Another function of VGAM1793 is therefore inhibition of KIAA0217 (Accession XM\_040265). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. KIAA0848 (Accession NM\_014926) is another VGAM1793 host target gene. KIAA0848 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0848 BINDING SITE, designated SEQ ID:17214, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59855] Another function of VGAM1793 is therefore inhibition of KIAA0848 (Accession NM\_014926). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0848. KIAA1467 (Accession XM\_049605) is another VGAM1793 host target gene. KIAA1467 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1467 BINDING SITE, designated SEQ ID:35457, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59856] Another function of VGAM1793 is therefore inhibition of

KIAA1467 (Accession XM\_049605). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1467. KIAA1582 (Accession XM\_037262) is another VGAM1793 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32587, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59857] Another function of VGAM1793 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1784 (Accession XM\_036660) is another VGAM1793 host target gene. KIAA1784 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1784 BINDING SITE, designated SEQ ID:32484, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59858] Another function of VGAM1793 is therefore inhibition of KIAA1784 (Accession XM\_036660). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1784. KIAA1908 (Accession XM\_055834) is another VGAM1793 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36333, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59859] Another function of VGAM1793 is therefore inhibition of KIAA1908 (Accession XM\_055834). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. KLK15 (Accession NM\_138563) is another

VGAM1793 host target gene. KLK15 BINDING SITE1 and KLK15 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK15, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK15 BINDING SITE1 and KLK15 BINDING SITE2, designated SEQ ID:28863 and SEQ ID:23265 respectively, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59860] Another function of VGAM1793 is therefore inhibition of KLK15 (Accession NM\_138563). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK15. MIG (Accession NM\_002416) is another VGAM1793 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8248, to the nucleotide sequence of VGAM1793 RNA, herein

designated VGAM RNA, also designated SEQ ID:4504.

[59861] Another function of VGAM1793 is therefore inhibition of MIG (Accession NM\_002416). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. NEU4 (Accession NM\_080741) is another VGAM1793 host target gene. NEU4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEU4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU4 BINDING SITE, designated SEQ ID:28027, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59862] Another function of VGAM1793 is therefore inhibition of NEU4 (Accession NM\_080741). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU4. Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM\_167803) is another VGAM1793 host target gene. PCANAP7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

PCANAP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCANAP7 BINDING SITE, designated SEQ ID:44837, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59863] Another function of VGAM1793 is therefore inhibition of Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM\_167803). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCANAP7. SAST (Accession XM\_032034) is another VGAM1793 host target gene. SAST BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SAST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAST BINDING SITE, designated SEQ ID:31543, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59864] Another function of VGAM1793 is therefore inhibition of SAST (Accession XM\_032034). Accordingly, utilities of

VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAST. Solute Carrier Family 26, Member 9 (SLC26A9, Accession NM\_134325) is another VGAM1793 host target gene. SLC26A9 BINDING SITE1 and SLC26A9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC26A9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A9 BINDING SITE1 and SLC26A9 BINDING SITE2, designated SEQ ID:28631 and SEQ ID:27493 respectively, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59865] Another function of VGAM1793 is therefore inhibition of Solute Carrier Family 26, Member 9 (SLC26A9, Accession NM\_134325). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A9. LOC118611 (Accession XM\_061055) is another VGAM1793 host target gene. LOC118611 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC118611, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118611 BINDING SITE, designated SEQ ID:37187, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59866] Another function of VGAM1793 is therefore inhibition of LOC118611 (Accession XM\_061055). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118611. LOC145989 (Accession XM\_004815) is another VGAM1793 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29950, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59867] Another function of VGAM1793 is therefore inhibition of LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145989. LOC148014 (Accession XM\_085999) is another VGAM1793 host target gene. LOC148014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148014 BINDING SITE, designated SEQ ID:38439, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59868] Another function of VGAM1793 is therefore inhibition of LOC148014 (Accession XM\_085999). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148014. LOC158435 (Accession NM\_138497) is another VGAM1793 host target gene. LOC158435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158435 BINDING SITE, designated SEQ ID:28846, to

the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59869] Another function of VGAM1793 is therefore inhibition of LOC158435 (Accession NM\_138497). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158435. LOC158856 (Accession XM\_098998) is another VGAM1793 host target gene. LOC158856 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158856 BINDING SITE, designated SEQ ID:42035, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59870] Another function of VGAM1793 is therefore inhibition of LOC158856 (Accession XM\_098998). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158856. LOC163833 (Accession XM\_089174) is another VGAM1793 host target gene. LOC163833 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC163833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163833 BINDING SITE, designated SEQ ID:39968, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59871] Another function of VGAM1793 is therefore inhibition of LOC163833 (Accession XM\_089174). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163833. LOC168667 (Accession XM\_166592) is another VGAM1793 host target gene. LOC168667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC168667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168667 BINDING SITE, designated SEQ ID:44569, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59872] Another function of VGAM1793 is therefore inhibition of LOC168667 (Accession XM\_166592). Accordingly, utilities

of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168667. LOC197319 (Accession XM\_113862) is another VGAM1793 host target gene. LOC197319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:42477, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59873] Another function of VGAM1793 is therefore inhibition of LOC197319 (Accession XM\_113862). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197319. LOC202284 (Accession XM\_117372) is another VGAM1793 host target gene. LOC202284 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202284, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC202284 BINDING SITE, designated SEQ ID:43418, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59874] Another function of VGAM1793 is therefore inhibition of LOC202284 (Accession XM\_117372). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202284. LOC222183 (Accession XM\_168436) is another VGAM1793 host target gene. LOC222183 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222183 BINDING SITE, designated SEQ ID:45184, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59875] Another function of VGAM1793 is therefore inhibition of LOC222183 (Accession XM\_168436). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222183. LOC90120 (Accession XM\_029168) is another VGAM1793 host target gene. LOC90120 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90120 BINDING SITE, designated SEQ ID:30852, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59876] Another function of VGAM1793 is therefore inhibition of LOC90120 (Accession XM\_029168). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90120. LOC90499 (Accession XM\_032170) is another VGAM1793 host target gene. LOC90499 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90499 BINDING SITE, designated SEQ ID:31584, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59877] Another function of VGAM1793 is therefore inhibition of

LOC90499 (Accession XM\_032170). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90499. LOC96652 (Accession XM\_037474) is another VGAM1793 host target gene. LOC96652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC96652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96652 BINDING SITE, designated SEQ ID:32627, to the nucleotide sequence of VGAM1793 RNA, herein designated VGAM RNA, also designated SEQ ID:4504.

[59878] Another function of VGAM1793 is therefore inhibition of LOC96652 (Accession XM\_037474). Accordingly, utilities of VGAM1793 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96652. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1794 (VGAM1794) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[59879] VGAM1794 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1794 was detected is described hereinabove with reference to Figs. 1–8.

[59880] VGAM1794 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59881] VGAM1794 gene encodes a VGAM1794 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1794 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1794 precursor RNA is designated SEQ ID:1780, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1780 is located at position 84588 relative to the genome of Rana Tigrina Ranavirus.

[59882] VGAM1794 precursor RNA folds onto itself, forming VGAM1794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59883] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1794 folded precursor RNA into VGAM1794 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1794 RNA is designated SEQ ID:4505, and is provided hereinbelow with reference to the sequence listing part.

[59884] VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1794 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[59885] VGAM1794 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1794 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1794 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[59886] The complementary binding of VGAM1794 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1794 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1794 host target RNA into VGAM1794 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59887] It is appreciated that VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1794 host target genes. The mRNA of each one of this plurality of VGAM1794 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1794 RNA, herein designated VGAM RNA, and which when bound by VGAM1794 RNA causes inhibition of translation of respective one or more VGAM1794 host target proteins.

[59888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1794 gene, herein designated VGAM GENE, on one

or more VGAM1794 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59889] It is yet further appreciated that a function of VGAM1794 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1794 correlate with, and may be deduced from, the identity of the host target genes which VGAM1794 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59890] Nucleotide sequences of the VGAM1794 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1794 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1794 are further described hereinbelow with reference to Table 1.

[59891] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1794 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1794 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59892] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1794 gene, herein designated VGAM is inhibition of expression of VGAM1794 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1794 correlate with, and may be deduced from, the identity of the target genes which VGAM1794 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59893] Alkaline Phosphatase, Intestinal (ALPI, Accession

NM\_001631) is a VGAM1794 host target gene. ALPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALPI BINDING SITE, designated SEQ ID:7343, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59894] A function of VGAM1794 is therefore inhibition of Alkaline Phosphatase, Intestinal (ALPI, Accession NM\_001631), a gene which is a glycoprotein phosphatase. Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALPI. The function of ALPI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. Alkaline Phosphatase, Placental (Regan isozyme) (ALPP, Accession XM\_044131) is another VGAM1794 host target gene. ALPP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALPP BINDING SITE, designated SEQ ID:34138, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59895] Another function of VGAM1794 is therefore inhibition of Alkaline Phosphatase, Placental (Regan isozyme) (ALPP, Accession XM\_044131), a gene which is a placental alkaline phosphatase. Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALPP. The function of ALPP has been established by previous studies. Boyer (1961, 1963) described an electrophoretic variant of alkaline phosphatase (orthophosphoric monoester phosphohydrolase, alkaline optimum; EC 3.1.3.1), which appears in the serum during pregnancy in some women, and demonstrated its origin in the placenta. Since the human placenta is largely fetal in origin, the polymorphism may be a characteristic determined by the fetal genotype. Historically, this was the first described example of a polymorphic placental protein. Robson and Harris (1965) studied the genetics. Beckman et al. (1967) found a rare phenotype, absence of placental alkaline phosphatase, in

twins and suggested that these twins might be homozygous for a 'silent allele' ('null allele'). The twins were also concordant for Crouzon craniofacial dysostosis (OMIM Ref. No. 123500), raising the question of a causal relationship. Palmarino et al. (1979) found evidence for at least 11 different mutant alleles at the placental alkaline phosphatase locus. Garattini et al. (1985) demonstrated 'appreciable amounts' of placental alkaline phosphatase in extracts of liver and intestine. Kam et al. (1985) cloned placental alkaline phosphatase cDNA, sequenced it, and mapped the gene by direct spot-blot hybridization to the DNA of chromosomes resolved by dual laser chromosome sorting. A strong signal was obtained with chromosome 2. With longer exposure, a weaker signal appeared also on chromosome 17. They speculated that PLAP-related gene(s) may be located there. Human testis and thymus contain small amounts of an ALP closely resembling, but not identical to, placental ALP. This ALP has been referred to as placental-like ALP or the Nagao isoenzyme (Henthorn et al., 1987); see 171810. Millan and Stigbrand (1983) maintained that placental-like ALP was probably the product of a separate locus. Martin et al. (1987) used a cDNA probe in Southern blot analysis of somatic cell hybrid DNA and

in situ hybridization to locate PLAP to 2q37. Martin et al. (1987) described a RFLP of the PLAP gene. Griffin et al. (1987) mapped both the placental and the intestinal alkaline phosphatase genes to 2q34–q37 by chromosomal in situ hybridization and hybridization to the DNA of somatic cell hybrids. By in situ hybridization, Raimondi et al. (1988) assigned the ALPP gene to 2q37. Knoll et al. (1988) concluded that 3 closely related alkaline phosphatase genes reside on the long arm of chromosome 2 in man. One of these genes (PLAP; the placental ALP–1, in their symbology) encodes the classic heat-stabile placental alkaline phosphatase; a second (which they referred to as placental ALP–2) is closely related to the first, and may encode the so-called placental ALP-like enzyme of the testis and thymus; the third member of this gene family, the intestinal ALP gene, encodes intestinal alkaline phosphatase (OMIM Ref. No. 171740). The expression of the intestinal and placental genes is highly tissue-specific in spite of nearly 90% sequence similarity within their exons. Knoll et al. (1988) compared the placental alkaline phosphatase gene with the placental-like gene.

[59896] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[59897] Beckman, L.; Beckman, G.; Christodoulou, C.; Ifekwu-nigwe, A. : Variations in human placental alkaline phosphatase. *Acta Genet. Statist. Med.* 17: 406–412, 1967. ; and

[59898] Knoll, B. J.; Rothblum, K. N.; Longley, M. : Nucleotide sequence of the human placental alkaline phosphatase gene: evolution of the 5-prime flanking region by deletion/substitution. *J.*

[59899] Further studies establishing the function and utilities of ALPP are found in John Hopkins OMIM database record ID 171800, and in cited publications numbered 3253–3256, 3499, 3503–3507, 2498, 3508, 3509–351 and 3780 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mannosidase, Alpha, Class 2A, Member 2 (MAN2A2, Accession NM\_006122) is another VGAM1794 host target gene. MAN2A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2A2 BINDING SITE, designated SEQ

ID:12765, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59900] Another function of VGAM1794 is therefore inhibition of Mannosidase, Alpha, Class 2A, Member 2 (MAN2A2, Accession NM\_006122), a gene which is an enzyme involved in the processing of N-linked glycans. Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2A2. The function of MAN2A2 has been established by previous studies. Golgi alpha-mannosidase II (OMIM Ref. No. 154582) is an enzyme involved in the processing of N-linked glycans. Using a previously isolated murine cDNA clone as a probe, Misago et al. (1995) isolated cDNA clones encompassing the human MANA2 cDNA open reading frame. During the isolation of genomic clones, genes related to that encoding alpha-mannosidase II were isolated. One such gene was found to encode an isozyme, which they designated alpha-mannosidase II(x). A 5-kb cDNA clone of the MANA2X gene was then isolated from a human melanoma cDNA library. Comparison between the MANA2X and MANA2 cDNAs suggested that the cloned cDNA encodes a truncated

polypeptide with 796 amino acid residues, while the product of the MANA2 gene consists of 1144 amino acid residues. However, further studies indicated that alternative splicing of the MANA2X transcript can result in an additional transcript encoding an 1139-amino acid polypeptide. Northern analysis showed transcription of MANA2X in various tissues, suggesting that it is a housekeeping gene. COS cells transfected with MANA2X cDNA containing the full-length open reading frame showed an increase in alpha-mannosidase activity. Animal model experiments lend further support to the function of MAN2A2. Akama et al. (2002) generated mice deficient for the Man2a2 gene, which encodes alpha-mannosidase-IIx, an enzyme that forms intermediate asparagine-linked carbohydrates (N-glycans). Male mice lacking Man2a2 are largely infertile. The Man2a2-null spermatogenic cells fail to adhere to Sertoli cells and are prematurely released from the testis to the epididymis. Akama et al. (2002) identified an N-glycan structure that plays a key role in germ cell-Sertoli cell adhesion and identified a specific carbohydrate that is required for spermatogenesis. This carbohydrate is designated 310.11 and is an N-acetylglucosamine-terminated tri-antennary and fucosy-

lated N-glycan structure.

[59901] It is appreciated that the abovementioned animal model for MAN2A2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[59902] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[59903] Misago, M.; Liao, Y.-F.; Kudo, S.; Eto, S.; Mattei, M.-G.; Moremen, K. W.; Fukuda, M. N. : Molecular cloning and expression of cDNAs encoding human alpha-mannosidase II and a previously unrecognized alpha-mannosidase II(X) isozyme. Proc. Nat. Acad. Sci. 92: 11766-11770, 1995. ; and

[59904] Akama, T. O.; Nakagawa, H.; Sugihara, K.; Narisawa, S.; Ohyama, C.; Nishimura, S.-I.; O'Brien, D. A.; Moremen, K. W.; Millan, J. L.; Fukuda, M. N. : Germ cell survival through carbohydra.

[59905] Further studies establishing the function and utilities of MAN2A2 are found in John Hopkins OMIM database record ID 600988, and in cited publications numbered 716 and 11529 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Parkinson

Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM\_013987) is another VGAM1794 host target gene. PARK2 BINDING SITE1 through PARK2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PARK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARK2 BINDING SITE1 through PARK2 BINDING SITE3, designated SEQ ID:15151, SEQ ID:15158 and SEQ ID:10904 respectively, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59906] Another function of VGAM1794 is therefore inhibition of Parkinson Disease (autosomal recessive, juvenile) 2, Parkin (PARK2, Accession NM\_013987). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARK2. FLJ10352 (Accession NM\_032142) is another VGAM1794 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:25824, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59907] Another function of VGAM1794 is therefore inhibition of FLJ10352 (Accession NM\_032142). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. KIAA0935 (Accession XM\_052620) is another VGAM1794 host target gene. KIAA0935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:36010, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59908] Another function of VGAM1794 is therefore inhibition of KIAA0935 (Accession XM\_052620). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0935. KIAA1061 (Accession XM\_048786) is another VGAM1794 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35265, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59909] Another function of VGAM1794 is therefore inhibition of KIAA1061 (Accession XM\_048786). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061. KIAA1750 (Accession XM\_043067) is another VGAM1794 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33873, to the nucleotide sequence of VGAM1794 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4505.

[59910] Another function of VGAM1794 is therefore inhibition of KIAA1750 (Accession XM\_043067). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. KIAA1881 (Accession XM\_170901) is another VGAM1794 host target gene. KIAA1881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1881 BINDING SITE, designated SEQ ID:45654, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59911] Another function of VGAM1794 is therefore inhibition of KIAA1881 (Accession XM\_170901). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1881. Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM\_004759) is another VGAM1794 host target gene. MAPKAPK2 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by MAPKAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPKAPK2 BINDING SITE, designated SEQ ID:11148, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59912] Another function of VGAM1794 is therefore inhibition of Mitogen-activated Protein Kinase-activated Protein Kinase 2 (MAPKAPK2, Accession NM\_004759). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK2. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564) is another VGAM1794 host target gene. SLC39A3 BINDING SITE1 and SLC39A3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC39A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3 BINDING SITE1 and SLC39A3 BINDING SITE2, designated SEQ ID:29354 and SEQ ID:29355 respectively, to the nucleotide sequence of

VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59913] Another function of VGAM1794 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. LOC51134 (Accession NM\_016122) is another VGAM1794 host target gene. LOC51134 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51134 BINDING SITE, designated SEQ ID:18209, to the nucleotide sequence of VGAM1794 RNA, herein designated VGAM RNA, also designated SEQ ID:4505.

[59914] Another function of VGAM1794 is therefore inhibition of LOC51134 (Accession NM\_016122). Accordingly, utilities of VGAM1794 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1795 (VGAM1795) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59915] VGAM1795 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1795 was detected is described hereinabove with reference to Figs. 1–8.

[59916] VGAM1795 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59917] VGAM1795 gene encodes a VGAM1795 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1795 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1795 precursor RNA is designated SEQ ID:1781, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1781 is located at position 85710 relative to the

genome of Rana Tigrina Ranavirus.

[59918] VGAM1795 precursor RNA folds onto itself, forming VGAM1795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59919] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1795 folded precursor RNA into VGAM1795 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1795 RNA is designated SEQ ID:4506, and is provided hereinbelow with reference to the sequence listing part.

[59920] VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1795 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59921] VGAM1795 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1795 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1795 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59922] The complementary binding of VGAM1795 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1795 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1795 host target RNA into VGAM1795 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59923] It is appreciated that VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1795 host target genes. The mRNA of each one of this plurality of VGAM1795 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1795 RNA, herein designated VGAM RNA, and which when bound by VGAM1795 RNA causes inhibition of translation of respective one or more VGAM1795 host target proteins.

[59924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1795 gene, herein designated VGAM GENE, on one or more VGAM1795 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59925] It is yet further appreciated that a function of VGAM1795 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1795 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1795

correlate with, and may be deduced from, the identity of the host target genes which VGAM1795 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59926] Nucleotide sequences of the VGAM1795 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1795 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1795 are further described hereinbelow with reference to Table 1.

[59927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1795 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1795 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59928] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1795 gene, herein designated VGAM is inhibition of expression of VGAM1795 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1795 correlate with, and may be deduced

from, the identity of the target genes which VGAM1795 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59929] LOC157663 (Accession XM\_088354) is a VGAM1795 host target gene. LOC157663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157663 BINDING SITE, designated SEQ ID:39638, to the nucleotide sequence of VGAM1795 RNA, herein designated VGAM RNA, also designated SEQ ID:4506.

[59930] A function of VGAM1795 is therefore inhibition of LOC157663 (Accession XM\_088354). Accordingly, utilities of VGAM1795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157663. LOC254228 (Accession XM\_171123) is another VGAM1795 host target gene. LOC254228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45919, to the nucleotide sequence of VGAM1795 RNA, herein designated VGAM RNA, also designated SEQ ID:4506.

[59931] Another function of VGAM1795 is therefore inhibition of LOC254228 (Accession XM\_171123). Accordingly, utilities of VGAM1795 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1796 (VGAM1796) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59932] VGAM1796 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1796 was detected is described hereinabove with reference to Figs. 1–8.

[59933] VGAM1796 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[59934] VGAM1796 gene encodes a VGAM1796 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1796 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1796 precursor RNA is designated SEQ ID:1782, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1782 is located at position 79650 relative to the genome of Rana Tigrina Ranavirus.

[59935] VGAM1796 precursor RNA folds onto itself, forming VGAM1796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59936] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1796 folded precursor RNA into VGAM1796 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1796 RNA is designated SEQ ID:4507, and is provided hereinbelow with reference to the sequence listing part.

[59937] VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1796 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59938] VGAM1796 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1796 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1796 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59939] The complementary binding of VGAM1796 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1796 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1796 host target RNA into VGAM1796 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59940] It is appreciated that VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1796 host target genes. The mRNA of each one of this plurality of VGAM1796 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1796 RNA, herein designated VGAM RNA, and which when bound by VGAM1796 RNA causes inhibition of translation of respective one or more VGAM1796 host target proteins.

[59941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1796 gene, herein designated VGAM GENE, on one or more VGAM1796 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59942] It is yet further appreciated that a function of VGAM1796 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1796 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1796 correlate with, and may be deduced from, the identity of the host target genes which VGAM1796 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59943] Nucleotide sequences of the VGAM1796 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1796 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1796 are further described hereinbelow with reference to Table 1.

[59944] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1796 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1796 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59945] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1796 gene, herein designated VGAM is inhibition of expression of VGAM1796 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1796 correlate with, and may be deduced from, the identity of the target genes which VGAM1796 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59946] Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM\_018956) is a VGAM1796 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21027, to the nucleotide sequence of VGAM1796 RNA, herein designated VGAM RNA, also designated SEQ ID:4507.

[59947] A function of VGAM1796 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM\_018956). Accordingly, utilities of VGAM1796 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. KIAA0472 (Accession XM\_050147) is another VGAM1796 host target gene. KIAA0472 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35577, to the nucleotide sequence of VGAM1796 RNA, herein designated VGAM RNA, also designated SEQ ID:4507.

[59948] Another function of VGAM1796 is therefore inhibition of KIAA0472 (Accession XM\_050147). Accordingly, utilities of VGAM1796 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. LOC158402 (Accession XM\_098936) is another VGAM1796 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158402, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41975, to the nucleotide sequence of VGAM1796 RNA, herein designated VGAM RNA, also designated SEQ ID:4507.

[59949] Another function of VGAM1796 is therefore inhibition of LOC158402 (Accession XM\_098936). Accordingly, utilities of VGAM1796 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1797 (VGAM1797) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[59950] VGAM1797 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1797 was detected is described hereinabove with reference to Figs. 1-8.

[59951] VGAM1797 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus.

VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[59952] VGAM1797 gene encodes a VGAM1797 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1797 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1797 precursor RNA is designated SEQ ID:1783, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1783 is located at position 82741 relative to the genome of Rana Tigrina Ranavirus.

[59953] VGAM1797 precursor RNA folds onto itself, forming VGAM1797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[59954] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1797 folded precursor RNA into VGAM1797 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1797 RNA is designated SEQ ID:4508, and is provided hereinbelow with reference to the sequence listing part.

[59955] VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1797 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[59956] VGAM1797 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1797 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1797 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[59957] The complementary binding of VGAM1797 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1797 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1797 host target RNA into VGAM1797 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[59958] It is appreciated that VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1797 host target genes. The mRNA of each one of this plurality of VGAM1797 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1797 RNA, herein designated VGAM RNA, and which when bound by VGAM1797 RNA causes inhibition of translation of respective one or more VGAM1797 host target proteins.

[59959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1797 gene, herein designated VGAM GENE, on one or more VGAM1797 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[59960] It is yet further appreciated that a function of VGAM1797 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1797 correlate with, and may be deduced from, the identity of the host target genes which VGAM1797 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[59961] Nucleotide sequences of the VGAM1797 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1797 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1797 are further described hereinbelow with reference to Table 1.

[59962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1797 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1797 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[59963] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1797 gene, herein designated VGAM is inhibition of expression of VGAM1797 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1797 correlate with, and may be deduced from, the identity of the target genes which VGAM1797 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[59964] Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM\_007332) is a VGAM1797 host target gene. ANKTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKTM1 BINDING SITE, designated SEQ

ID:14258, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59965] A function of VGAM1797 is therefore inhibition of Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM\_007332), a gene which attaches integral membrane proteins to cytoskeletal elements. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKTM1. The function of ANKTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644. Copine III (CPNE3, Accession NM\_003909) is another VGAM1797 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:9996, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59966] Another function of VGAM1797 is therefore inhibition of

Copine III (CPNE3, Accession NM\_003909), a gene which may function in membrane trafficking. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Dual Specificity Phosphatase 5 (DUSP5, Accession NM\_004419) is another VGAM1797 host target gene. DUSP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP5 BINDING SITE, designated SEQ ID:10684, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59967] Another function of VGAM1797 is therefore inhibition of Dual Specificity Phosphatase 5 (DUSP5, Accession NM\_004419), a gene which displays phosphatase activity toward several substrates. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with DUSP5. The function of DUSP5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Guanylate Cyclase 1, Soluble, Beta 2 (GUCY1B2, Accession NM\_004129) is another VGAM1797 host target gene. GUCY1B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GUCY1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GUCY1B2 BINDING SITE, designated SEQ ID:10336, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59968] Another function of VGAM1797 is therefore inhibition of Guanylate Cyclase 1, Soluble, Beta 2 (GUCY1B2, Accession NM\_004129), a gene which is beta 2 subunit of soluble guanylate cyclase which converts GTP into the second messenger cGMP and plays a major role in the cardiovascular system as a receptor for nitric oxide. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with GUCY1B2. The function of GUCY1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM379. Neuralized-like (Drosophila) (NEURL, Accession NM\_004210) is another VGAM1797 host target gene. NEURL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEURL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:10414, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59969] Another function of VGAM1797 is therefore inhibition of Neuralized-like (Drosophila) (NEURL, Accession NM\_004210). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL. RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM\_002869) is another VGAM1797 host target gene. RAB6A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB6A, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6A BINDING SITE, designated SEQ ID:8778, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59970] Another function of VGAM1797 is therefore inhibition of RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM\_002869), a gene which is involved in protein trafficking. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6A. The function of RAB6A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Regulator of G-protein Signalling 5 (RGS5, Accession NM\_003617) is another VGAM1797 host target gene. RGS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS5 BINDING SITE, designated SEQ ID:9679, to the nucleotide se-

quence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59971] Another function of VGAM1797 is therefore inhibition of Regulator of G-protein Signalling 5 (RGS5, Accession NM\_003617). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS5. Synaptosomal-associated Protein, 23kDa (SNAP23, Accession NM\_003825) is another VGAM1797 host target gene. SNAP23 BINDING SITE1 and SNAP23 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNAP23, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE1 and SNAP23 BINDING SITE2, designated SEQ ID:9921 and SEQ ID:28286 respectively, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59972] Another function of VGAM1797 is therefore inhibition of Synaptosomal-associated Protein, 23kDa (SNAP23, Accession NM\_003825), a gene which is essential component of the high affinity receptor for the general membrane fusion

machinery. Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23. The function of SNAP23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533. Zinc Finger Protein 264 (ZNF264, Accession NM\_003417) is another VGAM1797 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9457, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59973] Another function of VGAM1797 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM\_003417). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Acces-

sion XM\_031949) is another VGAM1797 host target gene. ACTR1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACTR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR1A BINDING SITE, designated SEQ ID:31531, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59974] Another function of VGAM1797 is therefore inhibition of ARP1 Actin-related Protein 1 Homolog A, Centractin Alpha (yeast) (ACTR1A, Accession XM\_031949). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR1A. Activating Transcription Factor 3 (ATF3, Accession NM\_004024) is another VGAM1797 host target gene. ATF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:10243,

to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59975] Another function of VGAM1797 is therefore inhibition of Activating Transcription Factor 3 (ATF3, Accession NM\_004024). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3. BANK (Accession NM\_017935) is another VGAM1797 host target gene. BANK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANK BINDING SITE, designated SEQ ID:19626, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59976] Another function of VGAM1797 is therefore inhibition of BANK (Accession NM\_017935). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANK. Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM\_007175) is another VGAM1797 host target gene. C8orf2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by C8orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE, designated SEQ ID:14023, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59977] Another function of VGAM1797 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM\_007175). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf2. Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614) is another VGAM1797 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13393, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ

ID:4508.

[59978] Another function of VGAM1797 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. COE2 (Accession XM\_034639) is another VGAM1797 host target gene. COE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COE2 BINDING SITE, designated SEQ ID:32130, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59979] Another function of VGAM1797 is therefore inhibition of COE2 (Accession XM\_034639). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COE2. Death-associated Protein Kinase 2 (DA PK2, Accession NM\_014326) is another VGAM1797 host target gene. DAPK2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by DAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:15636, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59980] Another function of VGAM1797 is therefore inhibition of Death-associated Protein Kinase 2 (DAPK2, Accession NM\_014326). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2. ERAP140 (Accession XM\_059748) is another VGAM1797 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37087, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59981] Another function of VGAM1797 is therefore inhibition of ERAP140 (Accession XM\_059748). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. FLJ10201 (Accession NM\_018023) is another VGAM1797 host target gene. FLJ10201 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10201 BINDING SITE, designated SEQ ID:19764, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59982] Another function of VGAM1797 is therefore inhibition of FLJ10201 (Accession NM\_018023). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10201. FLJ30567 (Accession NM\_145022) is another VGAM1797 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:29633, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59983] Another function of VGAM1797 is therefore inhibition of FLJ30567 (Accession NM\_145022). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM\_133443) is another VGAM1797 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:28526, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59984] Another function of VGAM1797 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM\_133443). Accordingly, util-

ities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. HIC (Accession XM\_041273) is another VGAM1797 host target gene. HIC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC BINDING SITE, designated SEQ ID:33495, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59985] Another function of VGAM1797 is therefore inhibition of HIC (Accession XM\_041273). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC. High Mobility Group Nucleosomal Binding Domain 4 (HMGN4, Accession NM\_006353) is another VGAM1797 host target gene. HMGN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMGN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HMGN4 BINDING SITE, designated SEQ ID:13048, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59986] Another function of VGAM1797 is therefore inhibition of High Mobility Group Nucleosomal Binding Domain 4 (HMGN4, Accession NM\_006353). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGN4. HSPC039 (Accession NM\_016097) is another VGAM1797 host target gene. HSPC039 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC039 BINDING SITE, designated SEQ ID:18181, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59987] Another function of VGAM1797 is therefore inhibition of HSPC039 (Accession NM\_016097). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

HSPC039. KIAA0637 (Accession NM\_014838) is another VGAM1797 host target gene. KIAA0637 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0637, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0637 BINDING SITE, designated SEQ ID:16861, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59988] Another function of VGAM1797 is therefore inhibition of KIAA0637 (Accession NM\_014838). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0637. KIAA1136 (Accession XM\_166110) is another VGAM1797 host target gene. KIAA1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1136 BINDING SITE, designated SEQ ID:43885, to the nucleotide sequence of VGAM1797 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4508.

[59989] Another function of VGAM1797 is therefore inhibition of KIAA1136 (Accession XM\_166110). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1136. KIAA1464 (Accession XM\_043069) is another VGAM1797 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33885, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59990] Another function of VGAM1797 is therefore inhibition of KIAA1464 (Accession XM\_043069). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. KIAA1948 (Accession XM\_091984) is another VGAM1797 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1948, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40082, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59991] Another function of VGAM1797 is therefore inhibition of KIAA1948 (Accession XM\_091984). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. LBP-9 (Accession NM\_014553) is another VGAM1797 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15879, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59992] Another function of VGAM1797 is therefore inhibition of LBP-9 (Accession NM\_014553). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LBP-9. MacGAP (Accession NM\_033515) is another VGAM1797 host target gene. MacGAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MacGAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MacGAP BINDING SITE, designated SEQ ID:27288, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59993] Another function of VGAM1797 is therefore inhibition of MacGAP (Accession NM\_033515). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MacGAP. MGC5242 (Accession NM\_024033) is another VGAM1797 host target gene. MGC5242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5242 BINDING SITE, designated SEQ ID:23463, to the nucleotide

sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59994] Another function of VGAM1797 is therefore inhibition of MGC5242 (Accession NM\_024033). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5242. N4BP2 (Accession NM\_018177) is another VGAM1797 host target gene. N4BP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by N4BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP2 BINDING SITE, designated SEQ ID:20004, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59995] Another function of VGAM1797 is therefore inhibition of N4BP2 (Accession NM\_018177). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP2. Olfactomedin 3 (OLFM3, Accession XM\_088951) is another VGAM1797 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:39960, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59996] Another function of VGAM1797 is therefore inhibition of Olfactomedin 3 (OLFM3, Accession XM\_088951). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM3. PRO2133 (Accession NM\_018619) is another VGAM1797 host target gene. PRO2133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2133 BINDING SITE, designated SEQ ID:20692, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59997] Another function of VGAM1797 is therefore inhibition of PRO2133 (Accession NM\_018619). Accordingly, utilities of

VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2133. RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM\_032144) is another VGAM1797 host target gene. RAB6C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB6C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6C BINDING SITE, designated SEQ ID:25835, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59998] Another function of VGAM1797 is therefore inhibition of RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM\_032144). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6C. Ribosomal Protein S6 Kinase, 52kDa, Polypeptide 1 (RPS6KC1, Accession NM\_012424) is another VGAM1797 host target gene. RPS6KC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KC1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KC1 BINDING SITE, designated SEQ ID:14801, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[59999] Another function of VGAM1797 is therefore inhibition of Ribosomal Protein S6 Kinase, 52kDa, Polypeptide 1 (RPS6KC1, Accession NM\_012424). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KC1. SE57-1 (Accession NM\_025214) is another VGAM1797 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24889, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60000] Another function of VGAM1797 is therefore inhibition of SE57-1 (Accession NM\_025214). Accordingly, utilities of

VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. TED (Accession NM\_015686) is another VGAM1797 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17921, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60001] Another function of VGAM1797 is therefore inhibition of TED (Accession NM\_015686). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. TTY7 (Accession NM\_031926) is another VGAM1797 host target gene. TTY7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TTY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY7 BINDING SITE, designated SEQ

ID:25673, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60002] Another function of VGAM1797 is therefore inhibition of TTY7 (Accession NM\_031926). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY7. Wingless-type MMTV Integration Site Family, Member 16 (WNT16, Accession NM\_016087) is another VGAM1797 host target gene. WNT16 BINDING SITE1 and WNT16 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT16, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT16 BINDING SITE1 and WNT16 BINDING SITE2, designated SEQ ID:18172 and SEQ ID:27676 respectively, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60003] Another function of VGAM1797 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 16 (WNT16, Accession NM\_016087). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with WNT16. Zinc Finger Protein 347 (ZNF347, Accession NM\_032584) is another VGAM1797 host target gene. ZNF347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF347 BINDING SITE, designated SEQ ID:26319, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60004] Another function of VGAM1797 is therefore inhibition of Zinc Finger Protein 347 (ZNF347, Accession NM\_032584). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF347. LOC153516 (Accession NM\_138491) is another VGAM1797 host target gene. LOC153516 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153516 BINDING SITE, desig-

nated SEQ ID:28842, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60005] Another function of VGAM1797 is therefore inhibition of LOC153516 (Accession NM\_138491). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153516. LOC160646 (Accession XM\_090413) is another VGAM1797 host target gene. LOC160646 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC160646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160646 BINDING SITE, designated SEQ ID:40001, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60006] Another function of VGAM1797 is therefore inhibition of LOC160646 (Accession XM\_090413). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160646. LOC200609 (Accession XM\_117256) is another VGAM1797 host target gene. LOC200609 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43334, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60007] Another function of VGAM1797 is therefore inhibition of LOC200609 (Accession XM\_117256). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC221069 (Accession XM\_167676) is another VGAM1797 host target gene. LOC221069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221069 BINDING SITE, designated SEQ ID:44768, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60008] Another function of VGAM1797 is therefore inhibition of

LOC221069 (Accession XM\_167676). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221069. LOC255461 (Accession XM\_173207) is another VGAM1797 host target gene. LOC255461 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255461 BINDING SITE, designated SEQ ID:46466, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60009] Another function of VGAM1797 is therefore inhibition of LOC255461 (Accession XM\_173207). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255461. LOC255516 (Accession XM\_173212) is another VGAM1797 host target gene. LOC255516 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC255516 BINDING SITE, designated SEQ ID:46472, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60010] Another function of VGAM1797 is therefore inhibition of LOC255516 (Accession XM\_173212). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255516. LOC51020 (Accession NM\_016063) is another VGAM1797 host target gene. LOC51020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51020 BINDING SITE, designated SEQ ID:18138, to the nucleotide sequence of VGAM1797 RNA, herein designated VGAM RNA, also designated SEQ ID:4508.

[60011] Another function of VGAM1797 is therefore inhibition of LOC51020 (Accession NM\_016063). Accordingly, utilities of VGAM1797 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51020. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1798 (VGAM1798) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60012] VGAM1798 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1798 was detected is described hereinabove with reference to Figs. 1–8.

[60013] VGAM1798 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60014] VGAM1798 gene encodes a VGAM1798 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1798 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1798 precursor RNA is designated SEQ ID:1784, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1784 is located at position 85493 relative to the genome of Rana Tigrina Ranavirus.

[60015] VGAM1798 precursor RNA folds onto itself, forming VGAM1798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60016] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1798 folded precursor RNA into VGAM1798 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1798 RNA is designated SEQ ID:4509, and is provided hereinbelow with reference to the sequence listing part.

[60017] VGAM1798 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1798 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60018] VGAM1798 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1798 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1798 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1798 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[60019] The complementary binding of VGAM1798 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1798 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1798 host target RNA into VGAM1798 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60020] It is appreciated that VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1798 host target genes. The mRNA of each one of this plurality of VGAM1798 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1798 RNA, herein designated VGAM RNA, and which when bound by VGAM1798 RNA causes inhibition of translation of respective one or more

VGAM1798 host target proteins.

[60021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1798 gene, herein designated VGAM GENE, on one or more VGAM1798 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60022] It is yet further appreciated that a function of VGAM1798 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1798 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus.

Specific functions, and accordingly utilities, of VGAM1798 correlate with, and may be deduced from, the identity of the host target genes which VGAM1798 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60023] Nucleotide sequences of the VGAM1798 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1798 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1798 are further described hereinbelow with reference to Table 1.

[60024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1798 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1798 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60025] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1798 gene, herein designated VGAM is inhibition of expression of VGAM1798 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1798 correlate with, and may be deduced from, the identity of the target genes which VGAM1798 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60026] Synaptosomal-associated Protein, 25kDa (SNAP25, Accession NM\_003081) is a VGAM1798 host target gene.

SNAP25 BINDING SITE1 and SNAP25 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNAP25, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP25 BINDING SITE1 and SNAP25 BINDING SITE2, designated SEQ ID:9054 and SEQ ID:28317 respectively, to the nucleotide sequence of VGAM1798 RNA, herein designated VGAM RNA, also designated SEQ ID:4509.

[60027] A function of VGAM1798 is therefore inhibition of Synaptosomal-associated Protein, 25kDa (SNAP25, Accession NM\_003081). Accordingly, utilities of VGAM1798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP25. LOC158332 (Accession XM\_088554) is another VGAM1798 host target gene. LOC158332 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LOC158332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158332 BINDING SITE, designated SEQ ID:39823, to the nucleotide sequence of VGAM1798 RNA, herein designated VGAM RNA, also designated SEQ ID:4509.

[60028] Another function of VGAM1798 is therefore inhibition of LOC158332 (Accession XM\_088554). Accordingly, utilities of VGAM1798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158332. LOC84549 (Accession NM\_032509) is another VGAM1798 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26259, to the nucleotide sequence of VGAM1798 RNA, herein designated VGAM RNA, also designated SEQ ID:4509.

[60029] Another function of VGAM1798 is therefore inhibition of

LOC84549 (Accession NM\_032509). Accordingly, utilities of VGAM1798 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1799 (VGAM1799) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60030] VGAM1799 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1799 was detected is described hereinabove with reference to Figs. 1-8.

[60031] VGAM1799 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60032] VGAM1799 gene encodes a VGAM1799 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1799 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1799 precursor RNA is designated SEQ ID:1785, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1785 is located at position 30160 relative to the genome of Tupaia Herpesvirus.

- [60033] VGAM1799 precursor RNA folds onto itself, forming VGAM1799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [60034] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1799 folded precursor RNA into VGAM1799 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1799 RNA is designated SEQ ID:4510, and is provided hereinbelow with reference to the sequence listing part.

[60035] VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1799 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60036] VGAM1799 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1799 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1799 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60037] The complementary binding of VGAM1799 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1799 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1799 host target RNA into VGAM1799 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60038] It is appreciated that VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1799 host target genes. The mRNA of each one of this plurality of VGAM1799 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1799 RNA, herein designated VGAM RNA, and which when bound by VGAM1799 RNA causes inhibition of translation of respective one or more VGAM1799 host target proteins.

[60039] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1799 gene, herein designated VGAM GENE, on one or more VGAM1799 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60040] It is yet further appreciated that a function of VGAM1799

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1799 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1799 correlate with, and may be deduced from, the identity of the host target genes which VGAM1799 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60041] Nucleotide sequences of the VGAM1799 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1799 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1799 are further described hereinbelow with reference to Table 1.

[60042] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1799 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1799 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60043] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1799 gene, herein designated VGAM is inhibition of expression of VGAM1799 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1799 correlate with, and may be deduced from, the identity of the target genes which VGAM1799 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60044] Cyclin F (CCNF, Accession NM\_001761) is a VGAM1799 host target gene. CCNF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:7523, to the nucleotide sequence of VGAM1799 RNA, herein designated VGAM RNA, also designated SEQ ID:4510.

[60045] A function of VGAM1799 is therefore inhibition of Cyclin F (CCNF, Accession NM\_001761), a gene which likely to be involved in the control of the cell cycle during S phase and G2. Accordingly, utilities of VGAM1799 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with CCNF. The function of CCNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM367.LOC200574 (Accession XM\_114264) is another VGAM1799 host target gene. LOC200574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200574 BINDING SITE, designated SEQ ID:42821, to the nucleotide sequence of VGAM1799 RNA, herein designated VGAM RNA, also designated SEQ ID:4510.

[60046] Another function of VGAM1799 is therefore inhibition of LOC200574 (Accession XM\_114264). Accordingly, utilities of VGAM1799 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200574. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1800 (VGAM1800) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[60047] VGAM1800 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1800 was detected is described hereinabove with reference to Figs. 1–8.

[60048] VGAM1800 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60049] VGAM1800 gene encodes a VGAM1800 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1800 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1800 precursor RNA is designated SEQ ID:1786, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1786 is located at position 23754 relative to the genome of Tupaia Herpesvirus.

[60050] VGAM1800 precursor RNA folds onto itself, forming VGAM1800 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60051] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1800 folded precursor RNA into VGAM1800 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1800 RNA is designated SEQ ID:4511, and is provided hereinbelow with reference to the sequence listing part.

[60052] VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1800 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60053] VGAM1800 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1800 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1800 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60054] The complementary binding of VGAM1800 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1800 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1800 host target RNA into VGAM1800 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60055] It is appreciated that VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1800 host target genes. The mRNA of each one of this plurality of VGAM1800 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1800 RNA, herein designated VGAM RNA, and which when bound by VGAM1800 RNA causes inhibition of translation of respective one or more VGAM1800 host target proteins.

[60056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1800 gene, herein designated VGAM GENE, on one or more VGAM1800 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60057] It is yet further appreciated that a function of VGAM1800 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1800 correlate with, and may be deduced from, the identity of the host target genes which VGAM1800 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[60058] Nucleotide sequences of the VGAM1800 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1800 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1800 are further described hereinbelow with reference to Table 1.

[60059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1800 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1800 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60060] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1800 gene, herein designated VGAM is inhibition of expression of VGAM1800 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1800 correlate with, and may be deduced from, the identity of the target genes which VGAM1800 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60061] Cyclin D2 (CCND2, Accession NM\_001759) is a VGAM1800 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7516, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60062] A function of VGAM1800 is therefore inhibition of Cyclin D2 (CCND2, Accession NM\_001759), a gene which is essential for the control of the cell cycle at the G1/S (start) transition. Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Cytochrome P450, Subfamily IVA, Polypeptide 11 (CYP4A11, Accession NM\_000778) is another VGAM1800 host target gene. CYP4A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CYP4A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4A11 BINDING SITE, designated SEQ ID:6418, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60063] Another function of VGAM1800 is therefore inhibition of Cytochrome P450, Subfamily IVA, Polypeptide 11 (CYP4A11, Accession NM\_000778), a gene which catalyzes the omega- and (omega-1)-hydroxylation of various fatty acids . Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4A11. The function of CYP4A11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM798. Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 1 (LILRB1, Accession NM\_006669) is another VGAM1800 host target gene. LILRB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LILRB1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LILRB1 BINDING SITE, designated SEQ ID:13485, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60064] Another function of VGAM1800 is therefore inhibition of Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 1 (LILRB1, Accession NM\_006669). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRB1. Vitamin D (1,25-dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376) is another VGAM1800 host target gene. VDR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5943, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60065] Another function of VGAM1800 is therefore inhibition of

Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR. Zinc Finger Protein 217 (ZNF217, Accession NM\_006526) is another VGAM1800 host target gene. ZNF217 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF217 BINDING SITE, designated SEQ ID:13278, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60066] Another function of VGAM1800 is therefore inhibition of Zinc Finger Protein 217 (ZNF217, Accession NM\_006526). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF217. ATPase, Class V, Type 10B (ATP10B, Accession XM\_032721) is another VGAM1800 host target gene. ATP10B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP10B, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10B BINDING SITE, designated SEQ ID:31733, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60067] Another function of VGAM1800 is therefore inhibition of ATPase, Class V, Type 10B (ATP10B, Accession XM\_032721). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10B. FLJ10246 (Accession NM\_018038) is another VGAM1800 host target gene. FLJ10246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10246 BINDING SITE, designated SEQ ID:19784, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60068] Another function of VGAM1800 is therefore inhibition of FLJ10246 (Accession NM\_018038). Accordingly, utilities of

VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10246. KIAA0532 (Accession XM\_047659) is another VGAM1800 host target gene. KIAA0532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0532 BINDING SITE, designated SEQ ID:35021, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60069] Another function of VGAM1800 is therefore inhibition of KIAA0532 (Accession XM\_047659). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0532. LAK-4P (Accession NM\_007267) is another VGAM1800 host target gene. LAK-4P BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAK-4P, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAK-4P

BINDING SITE, designated SEQ ID:14132, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60070] Another function of VGAM1800 is therefore inhibition of LAK-4P (Accession NM\_007267). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAK-4P. LOC146517 (Accession XM\_085491) is another VGAM1800 host target gene. LOC146517 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146517, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146517 BINDING SITE, designated SEQ ID:38182, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60071] Another function of VGAM1800 is therefore inhibition of LOC146517 (Accession XM\_085491). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146517. LOC149842 (Accession XM\_097745) is another VGAM1800 host target gene. LOC149842 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149842 BINDING SITE, designated SEQ ID:41089, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60072] Another function of VGAM1800 is therefore inhibition of LOC149842 (Accession XM\_097745). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149842. LOC254243 (Accession XM\_173233) is another VGAM1800 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46513, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60073] Another function of VGAM1800 is therefore inhibition of

LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC254413 (Accession XM\_173141) is another VGAM1800 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46402, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60074] Another function of VGAM1800 is therefore inhibition of LOC254413 (Accession XM\_173141). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC90038 (Accession XM\_028305) is another VGAM1800 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30650, to the nucleotide sequence of VGAM1800 RNA, herein designated VGAM RNA, also designated SEQ ID:4511.

[60075] Another function of VGAM1800 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM1800 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1801 (VGAM1801) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60076] VGAM1801 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1801 was detected is described hereinabove with reference to Figs. 1–8.

[60077] VGAM1801 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[60078] VGAM1801 gene encodes a VGAM1801 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1801 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1801 precursor RNA is designated SEQ ID:1787, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1787 is located at position 28609 relative to the genome of Tupaia Herpesvirus.

[60079] VGAM1801 precursor RNA folds onto itself, forming VGAM1801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60080] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1801 folded precursor RNA into VGAM1801 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1801 RNA is designated SEQ ID:4512, and is provided hereinbelow with reference to the sequence listing part.

[60081] VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1801 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60082] VGAM1801 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1801 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1801 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60083] The complementary binding of VGAM1801 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1801 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1801 host target RNA into VGAM1801 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60084] It is appreciated that VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1801 host target genes. The mRNA of each one of this plurality of VGAM1801 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1801 RNA, herein designated VGAM RNA, and which when bound by VGAM1801 RNA causes inhibition of translation of respective one or more VGAM1801 host target proteins.

[60085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1801 gene, herein designated VGAM GENE, on one or more VGAM1801 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60086] It is yet further appreciated that a function of VGAM1801 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1801 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1801 correlate with, and may be deduced from, the identity of the host target genes which VGAM1801 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60087] Nucleotide sequences of the VGAM1801 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1801 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1801 are further described hereinbelow with reference to Table 1.

[60088] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1801 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1801 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60089] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1801 gene, herein designated VGAM is inhibition of expression of VGAM1801 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1801 correlate with, and may be deduced from, the identity of the target genes which VGAM1801 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60090] COAS3 (Accession NM\_139020) is a VGAM1801 host target gene. COAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COAS3 BINDING SITE, designated SEQ ID:29121, to the nucleotide sequence of VGAM1801 RNA, herein designated VGAM RNA, also designated SEQ ID:4512.

[60091] A function of VGAM1801 is therefore inhibition of COAS3 (Accession NM\_139020). Accordingly, utilities of VGAM1801 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COAS3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1802 (VGAM1802) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60092] VGAM1802 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1802 was detected is described hereinabove with reference to Figs. 1-8.

[60093] VGAM1802 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60094] VGAM1802 gene encodes a VGAM1802 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1802 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1802 precursor RNA is designated SEQ ID:1788, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1788 is located at position 27372 relative to the genome of Tupaia Herpesvirus.

- [60095] VGAM1802 precursor RNA folds onto itself, forming VGAM1802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [60096] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1802 folded precursor RNA into VGAM1802 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM1802 RNA is designated SEQ ID:4513, and is provided hereinbelow with reference to the sequence listing part.

[60097] VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1802 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60098] VGAM1802 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1802 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1802 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60099] The complementary binding of VGAM1802 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1802 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1802 host target RNA into VGAM1802 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60100] It is appreciated that VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1802 host target genes. The mRNA of each one of this plurality of VGAM1802 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1802 RNA, herein designated VGAM RNA, and which when bound by VGAM1802 RNA causes inhibition of translation of respective one or more VGAM1802 host target proteins.

[60101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1802 gene, herein designated VGAM GENE, on one or more VGAM1802 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60102] It is yet further appreciated that a function of VGAM1802

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1802 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1802 correlate with, and may be deduced from, the identity of the host target genes which VGAM1802 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60103] Nucleotide sequences of the VGAM1802 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1802 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1802 are further described hereinbelow with reference to Table 1.

[60104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1802 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1802 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60105] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1802 gene, herein designated VGAM is inhibition of expression of VGAM1802 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1802 correlate with, and may be deduced from, the identity of the target genes which VGAM1802 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60106] MGC11061 (Accession NM\_032312) is a VGAM1802 host target gene. MGC11061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11061 BINDING SITE, designated SEQ ID:26115, to the nucleotide sequence of VGAM1802 RNA, herein designated VGAM RNA, also designated SEQ ID:4513.

[60107] A function of VGAM1802 is therefore inhibition of MGC11061 (Accession NM\_032312). Accordingly, utilities of VGAM1802 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11061. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1803 (VGAM1803) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60108] VGAM1803 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1803 was detected is described hereinabove with reference to Figs. 1–8.

[60109] VGAM1803 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60110] VGAM1803 gene encodes a VGAM1803 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1803 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1803 precursor RNA is designated SEQ ID:1789, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1789 is located at position 29560 relative to the genome of Tupaia Herpesvirus.

[60111] VGAM1803 precursor RNA folds onto itself, forming VGAM1803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60112] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1803 folded precursor RNA into VGAM1803 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1803 RNA is designated SEQ ID:4514, and is provided hereinbelow with reference to the sequence listing part.

[60113] VGAM1803 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1803 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60114] VGAM1803 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1803 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1803 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1803 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60115] The complementary binding of VGAM1803 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1803 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1803 host target RNA into VGAM1803 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60116] It is appreciated that VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1803 host target genes. The mRNA of each one of this plurality of VGAM1803 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1803 RNA, herein designated VGAM RNA, and which when bound by VGAM1803 RNA causes inhibition of translation of respective one or more

VGAM1803 host target proteins.

[60117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1803 gene, herein designated VGAM GENE, on one or more VGAM1803 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60118] It is yet further appreciated that a function of VGAM1803 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1803 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific

functions, and accordingly utilities, of VGAM1803 correlate with, and may be deduced from, the identity of the host target genes which VGAM1803 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60119] Nucleotide sequences of the VGAM1803 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1803 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1803 are further described hereinbelow with reference to Table 1.

[60120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1803 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1803 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60121] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1803 gene, herein designated VGAM is inhibition of expression of VGAM1803 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1803 correlate with, and may be deduced from, the identity of the target genes which VGAM1803 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60122] Chromosome 20 Open Reading Frame 177 (C20orf177, Accession XM\_030726) is a VGAM1803 host target gene. C20orf177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf177 BINDING SITE, designated SEQ ID:31128, to the nucleotide sequence of VGAM1803 RNA, herein designated VGAM RNA, also designated SEQ ID:4514.

[60123] A function of VGAM1803 is therefore inhibition of Chromosome 20 Open Reading Frame 177 (C20orf177, Accession XM\_030726). Accordingly, utilities of VGAM1803 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf177. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1804

(VGAM1804) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60124] VGAM1804 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1804 was detected is described hereinabove with reference to Figs. 1–8.

[60125] VGAM1804 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60126] VGAM1804 gene encodes a VGAM1804 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1804 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1804 precursor RNA is designated SEQ ID:1790, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1790 is located at position 30515 relative to the genome of Tupaia Herpesvirus.

[60127] VGAM1804 precursor RNA folds onto itself, forming

VGAM1804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60128] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1804 folded precursor RNA into VGAM1804 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1804 RNA is designated SEQ ID:4515, and is provided hereinbelow with reference to the sequence listing part.

[60129] VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1804 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60130] VGAM1804 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1804 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1804 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60131] The complementary binding of VGAM1804 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1804 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1804 host target RNA into VGAM1804 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60132] It is appreciated that VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1804 host target genes. The mRNA of each one of this plurality of VGAM1804 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1804 RNA, herein designated VGAM RNA, and which when bound by VGAM1804 RNA causes inhibition of translation of respective one or more VGAM1804 host target proteins.

[60133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1804 gene, herein designated VGAM GENE, on one or more VGAM1804 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60134] It is yet further appreciated that a function of VGAM1804 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1804 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1804 correlate with, and may be deduced from, the identity of the host target genes which VGAM1804 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[60135] Nucleotide sequences of the VGAM1804 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1804 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1804 are further described hereinbelow with reference to Table 1.

[60136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1804 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1804 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60137] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1804 gene, herein designated VGAM is inhibition of expression of VGAM1804 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1804 correlate with, and may be deduced from, the identity of the target genes which VGAM1804 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60138] Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM\_000647) is a VGAM1804 host target gene. CCR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR2 BINDING SITE, designated SEQ ID:6310, to the nucleotide sequence of VGAM1804 RNA, herein designated VGAM RNA, also designated SEQ ID:4515.

[60139] A function of VGAM1804 is therefore inhibition of Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM\_000647), a gene which binds chemokines and transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM1804 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with CCR2. The function of CCR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM206. Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM\_000242) is another VGAM1804 host target gene. MBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBL2 BINDING SITE, designated SEQ ID:5764, to the nucleotide sequence of VGAM1804 RNA, herein designated VGAM RNA, also designated SEQ ID:4515.

[60140] Another function of VGAM1804 is therefore inhibition of Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM\_000242). Accordingly, utilities of VGAM1804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBL2. PDGFA Associated Protein 1 (PDAP1, Accession XM\_166484) is another VGAM1804 host target gene.

PDAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDAP1 BINDING SITE, designated SEQ ID:44419, to the nucleotide sequence of VGAM1804 RNA, herein designated VGAM RNA, also designated SEQ ID:4515.

[60141] Another function of VGAM1804 is therefore inhibition of PDGFA Associated Protein 1 (PDAP1, Accession XM\_166484). Accordingly, utilities of VGAM1804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDAP1. KIAA1668 (Accession XM\_039236) is another VGAM1804 host target gene. KIAA1668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1668 BINDING SITE, designated SEQ ID:33026, to the nucleotide sequence of VGAM1804 RNA, herein designated VGAM RNA, also designated SEQ

ID:4515.

[60142] Another function of VGAM1804 is therefore inhibition of KIAA1668 (Accession XM\_039236). Accordingly, utilities of VGAM1804 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1668. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1805 (VGAM1805) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60143] VGAM1805 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1805 was detected is described hereinabove with reference to Figs. 1–8.

[60144] VGAM1805 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60145] VGAM1805 gene encodes a VGAM1805 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1805 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1805 precursor RNA is designated SEQ ID:1791, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1791 is located at position 33339 relative to the genome of Tupaia Herpesvirus.

[60146] VGAM1805 precursor RNA folds onto itself, forming VGAM1805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60147] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1805 folded precursor RNA into VGAM1805 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1805 RNA is designated SEQ ID:4516, and is provided hereinbelow with reference to the sequence listing part.

[60148] VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1805 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60149] VGAM1805 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1805 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1805 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60150] The complementary binding of VGAM1805 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1805 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1805 host target RNA into VGAM1805 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60151] It is appreciated that VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1805 host target genes. The mRNA of

each one of this plurality of VGAM1805 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1805 RNA, herein designated VGAM RNA, and which when bound by VGAM1805 RNA causes inhibition of translation of respective one or more VGAM1805 host target proteins.

[60152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1805 gene, herein designated VGAM GENE, on one or more VGAM1805 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[60153] It is yet further appreciated that a function of VGAM1805 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1805 correlate with, and may be deduced from, the identity of the host target genes which VGAM1805 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60154] Nucleotide sequences of the VGAM1805 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1805 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1805 are further described hereinbelow with reference to Table 1.

[60155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1805 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1805 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60156] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1805 gene, herein designated VGAM is inhibition of expression of VGAM1805 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1805 correlate with, and may be deduced from, the identity of the target genes which VGAM1805 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60157] Alcohol Dehydrogenase IB (class I), Beta Polypeptide (ADH1B, Accession XM\_052365) is a VGAM1805 host target gene. ADH1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADH1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH1B BINDING SITE, designated SEQ ID:35960, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60158] A function of VGAM1805 is therefore inhibition of Alcohol Dehydrogenase IB (class I), Beta Polypeptide (ADH1B, Ac-

cession XM\_052365), a gene which Alcohol dehydrogenase 2 (alcohol:NAD<sup>+</sup> oxidoreductase) class I beta subunit. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH1B. The function of ADH1B has been established by previous studies. See 103700 for evidence on the mapping of the ADH2 gene in the cluster of related genes on 4q22. According to the conclusion of Smith et al. (1973), locus ADH2 is expressed in the lung in early fetal life and remains active in this tissue throughout life. It is active also in liver after about the first trimester and gradually increases in activity so that in adults this locus is responsible for most of the liver ADH activity. It is active in the adult kidney. The 'atypical pH ratio' phenotype is probably determined by a variant allele at the ADH2 locus. Stamatoyannopoulos et al. (1975) found that 85% of Japanese carry an atypical liver ADH (ADH2 type). About the same proportion have alcohol sensitivity, which they suggest may be due to increased formation of acetaldehyde by persons with the atypical ADH. Bosron et al. (1980) found new molecular forms of human ADH, collectively designated ADH(Indianapolis), in 29% of liver specimens from black Americans. Three different Indianapolis

ADH phenotypes were identified by starch gel electrophoresis and 4 isolated by affinity and ion-exchange chromatography. One is a homodimer of a newly discovered subunit. The other 3 are heterodimers of this new subunit and the known subunits, alpha, beta-1, and gamma-1. Agarwal et al. (1981) could find no instance of the Indianapolis variant in Germany or Japan; it may be confined to American blacks. Bosron et al. (1983) concluded that the Indianapolis phenotypes reflect polymorphism at the ADH2 locus with the variant ADH(Indianapolis) allele coding for the beta-Indianapolis subunit. The frequency of this allele was 0.16 in black Americans and was not found in any of 63 livers from white Americans. The frequency of alleles at the ADH3 locus also differs in these 2 populations. Two of the 3 class I genes (ADHB and ADHC) are known to have alleles that produce enzymes that catalyze the oxidation of ethanol at different rates. At the protein level, the allelic series for ADH1B is generated by variation at 2 different sites at the genomic level: the ADH1B\*1 allele is composed of 47arg and 369arg, the ADH1B\*2 allele is composed of 47his and 369arg (see OMIM Ref. No. 103720.0001), and the ADH1B\*3 allele (103720.0002) is composed of 47arg and

369cys. Osier et al. (2002) stated that the 'double variant' (composed of 47his and 369cys) could exist but had not been observed.

[60159] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60160] Bosron, W. F.; Magnes, L. J.; Li, T.-K. : Human liver alcohol dehydrogenase: ADH(Indianapolis) results from genetic polymorphism at the ADH-2 gene locus. Biochem. Genet. 21: 735-744, 1983. ; and

[60161] Osier, M. V.; Pakstis, A. J.; Soodyall, H.; Comas, D.; Goldman, D.; Odunsi, A.; Okonofua, F.; Parnas, J.; Schulz, L. O.; Bertranpetit, J.; Bonne-Tamir, B.; Lu, R.-B.; Kidd, J. R.; Kidd.

[60162] Further studies establishing the function and utilities of ADH1B are found in John Hopkins OMIM database record ID 103720, and in cited publications numbered 819-822, 4161, 12101-829, 12096, 12102, 378 and 12103-503 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM\_004349) is another VGAM1805 host target gene. CBFA2T1 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T1 BINDING SITE, designated SEQ ID:10542, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60163] Another function of VGAM1805 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM\_004349), a gene which produces a chimeric gene made up of the 5-prime region of the AML1 gene fused to the 3-prime region of the ETO gene through translocation. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T1. The function of CBFA2T1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113. Doublesex and Mab-3 Related Transcription Factor 1 (DMRT1, Accession NM\_021951) is another VGAM1805 host target gene. DMRT1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMRT1 BINDING SITE, designated SEQ ID:22480, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60164] Another function of VGAM1805 is therefore inhibition of Doublesex and Mab-3 Related Transcription Factor 1 (DMRT1, Accession NM\_021951), a gene which May be involved in male sexual development. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMRT1. The function of DMRT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM59. Early Growth Response 3 (EGR3, Accession XM\_005040) is another VGAM1805 host target gene. EGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:29961, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60165] Another function of VGAM1805 is therefore inhibition of Early Growth Response 3 (EGR3, Accession XM\_005040), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3. The function of EGR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924) is another VGAM1805 host target gene. MEOX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEOX2 BINDING SITE, designated SEQ ID:12552, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ

ID:4516.

[60166] Another function of VGAM1805 is therefore inhibition of Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924), a gene which roles in mesoderm induction and, somitogenesis, and myogenic and sclerotomal differentiation. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEOX2. The function of MEOX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM\_056815) is another VGAM1805 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36436, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60167] Another function of VGAM1805 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM\_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655) is another VGAM1805 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8518, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60168] Another function of VGAM1805 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession

NM\_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM\_003479) is another VGAM1805 host target gene. PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTP4A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2, designated SEQ ID:9549 and SEQ ID:27829 respectively, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60169] Another function of VGAM1805 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM\_003479), a gene which is a protein tyrosine phosphatase which has a C-terminal preny-

lation site. Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A2. The function of PTP4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. TRAM (Accession NM\_014294) is another VGAM1805 host target gene. TRAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAM BINDING SITE, designated SEQ ID:15590, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60170] Another function of VGAM1805 is therefore inhibition of TRAM (Accession NM\_014294). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAM. CCR4-NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779) is another VGAM1805 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT8 BINDING SITE, designated SEQ ID:11181, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60171] Another function of VGAM1805 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. FYVE and Coiled–coil Domain Containing 1 (FYCO1, Accession NM\_024513) is another VGAM1805 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23713, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ

ID:4516.

[60172] Another function of VGAM1805 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM\_024513). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM\_002251) is another VGAM1805 host target gene. KCNS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE, designated SEQ ID:8041, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60173] Another function of VGAM1805 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM\_002251). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS1. KIAA1237 (Accession XM\_087386)

is another VGAM1805 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:39221, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60174] Another function of VGAM1805 is therefore inhibition of KIAA1237 (Accession XM\_087386). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. KIAA1254 (Accession XM\_046132) is another VGAM1805 host target gene. KIAA1254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1254 BINDING SITE, designated SEQ ID:34696, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60175] Another function of VGAM1805 is therefore inhibition of KIAA1254 (Accession XM\_046132). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1254. KIAA1287 (Accession XM\_085753) is another VGAM1805 host target gene. KIAA1287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1287 BINDING SITE, designated SEQ ID:38325, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60176] Another function of VGAM1805 is therefore inhibition of KIAA1287 (Accession XM\_085753). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1287. MGC14161 (Accession NM\_032892) is another VGAM1805 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26717, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60177] Another function of VGAM1805 is therefore inhibition of MGC14161 (Accession NM\_032892). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. MGC33182 (Accession XM\_062903) is another VGAM1805 host target gene. MGC33182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC33182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC33182 BINDING SITE, designated SEQ ID:37234, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60178] Another function of VGAM1805 is therefore inhibition of MGC33182 (Accession XM\_062903). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC33182. PRO1992 (Accession NM\_014107) is another VGAM1805 host target gene. PRO1992 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1992 BINDING SITE, designated SEQ ID:15331, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60179] Another function of VGAM1805 is therefore inhibition of PRO1992 (Accession NM\_014107). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1992. RABEX5 (Accession NM\_014504) is another VGAM1805 host target gene. RABEX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RABEX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABEX5 BINDING SITE, designated SEQ ID:15839, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM

RNA, also designated SEQ ID:4516.

[60180] Another function of VGAM1805 is therefore inhibition of RABEX5 (Accession NM\_014504). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABEX5. LOC118611 (Accession XM\_061055) is another VGAM1805 host target gene. LOC118611 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118611 BINDING SITE, designated SEQ ID:37189, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60181] Another function of VGAM1805 is therefore inhibition of LOC118611 (Accession XM\_061055). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118611. LOC152715 (Accession XM\_087511) is another VGAM1805 host target gene. LOC152715 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152715, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152715 BINDING SITE, designated SEQ ID:39303, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60182] Another function of VGAM1805 is therefore inhibition of LOC152715 (Accession XM\_087511). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152715. LOC220143 (Accession XM\_168046) is another VGAM1805 host target gene. LOC220143 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220143 BINDING SITE, designated SEQ ID:44956, to the nucleotide sequence of VGAM1805 RNA, herein designated VGAM RNA, also designated SEQ ID:4516.

[60183] Another function of VGAM1805 is therefore inhibition of LOC220143 (Accession XM\_168046). Accordingly, utilities of VGAM1805 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1806 (VGAM1806) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60184] VGAM1806 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1806 was detected is described hereinabove with reference to Figs. 1–8.

[60185] VGAM1806 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia Herpesvirus. VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60186] VGAM1806 gene encodes a VGAM1806 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1806 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1806 precursor RNA is desig-

nated SEQ ID:1792, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1792 is located at position 25245 relative to the genome of Tupaia Herpesvirus.

- [60187] VGAM1806 precursor RNA folds onto itself, forming VGAM1806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [60188] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1806 folded precursor RNA into VGAM1806 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1806 RNA is designated SEQ ID:4517, and is provided hereinbelow with reference to the sequence

listing part.

[60189] VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1806 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60190] VGAM1806 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1806 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1806 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60191] The complementary binding of VGAM1806 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1806 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1806 host target RNA into VGAM1806 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60192] It is appreciated that VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1806 host target genes. The mRNA of each one of this plurality of VGAM1806 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1806 RNA, herein designated VGAM

RNA, and which when bound by VGAM1806 RNA causes inhibition of translation of respective one or more VGAM1806 host target proteins.

[60193] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1806 gene, herein designated VGAM GENE, on one or more VGAM1806 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60194] It is yet further appreciated that a function of VGAM1806 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1806 include diagnosis, prevention and treatment of viral infection by Tupaia Herpesvirus. Specific functions, and accordingly utilities, of VGAM1806 correlate with, and may be deduced from, the identity of the host target genes which VGAM1806 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60195] Nucleotide sequences of the VGAM1806 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1806 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1806 are further described hereinbelow with reference to Table 1.

[60196] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1806 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1806 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60197] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1806 gene, herein designated VGAM is

inhibition of expression of VGAM1806 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1806 correlate with, and may be deduced from, the identity of the target genes which VGAM1806 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60198] Carbohydrate Kinase-like (CARKL, Accession NM\_013276) is a VGAM1806 host target gene. CARKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARKL BINDING SITE, designated SEQ ID:14941, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60199] A function of VGAM1806 is therefore inhibition of Carbohydrate Kinase-like (CARKL, Accession NM\_013276), a gene which is a putative carbohydrate kinase and may be a modifier for the cystinosis phenotype. Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARKL. The function of CARKL and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_015866) is another VGAM1806 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:18008, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60200] Another function of VGAM1806 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM\_015866), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM120.RAB18, Member RAS Oncogene Family (RAB18, Accession NM\_021252) is another VGAM1806 host target gene. RAB18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB18 BINDING SITE, designated SEQ ID:22223, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60201] Another function of VGAM1806 is therefore inhibition of RAB18, Member RAS Oncogene Family (RAB18, Accession NM\_021252), a gene which plays a role in apical endocytosis/recycling. Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB18. The function of RAB18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Tumor Necrosis Factor Receptor Superfamily, Member 11a, Activator of NFkB (TNFRSF11A, Accession NM\_003839) is another VGAM1806 host target gene. TN-

FRSF11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF11A BINDING SITE, designated SEQ ID:9931, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60202] Another function of VGAM1806 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 11a, Activator of NFkB (TNFRSF11A, Accession NM\_003839). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF11A. Zinc Finger Protein 192 (ZNF192, Accession NM\_006298) is another VGAM1806 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12992, to the nucleotide

sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60203] Another function of VGAM1806 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM\_006298). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. Adaptor-related Protein Complex 3, Delta 1 Subunit (AP3D1, Accession NM\_003938) is another VGAM1806 host target gene. AP3D1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP3D1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3D1 BINDING SITE, designated SEQ ID:10048, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60204] Another function of VGAM1806 is therefore inhibition of Adaptor-related Protein Complex 3, Delta 1 Subunit (AP3D1, Accession NM\_003938). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3D1.

CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779) is another VGAM1806 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT8 BINDING SITE, designated SEQ ID:11183, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60205] Another function of VGAM1806 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. FLJ10260 (Accession NM\_018042) is another VGAM1806 host target gene. FLJ10260 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10260 BINDING SITE,

designated SEQ ID:19787, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60206] Another function of VGAM1806 is therefore inhibition of FLJ10260 (Accession NM\_018042). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10260. FLJ12568 (Accession NM\_024993) is another VGAM1806 host target gene. FLJ12568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12568 BINDING SITE, designated SEQ ID:24553, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60207] Another function of VGAM1806 is therefore inhibition of FLJ12568 (Accession NM\_024993). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12568. Integrin, Beta 5 (ITGB5, Accession XM\_003029) is another VGAM1806 host target gene. ITGB5 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB5 BINDING SITE, designated SEQ ID:29923, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60208] Another function of VGAM1806 is therefore inhibition of Integrin, Beta 5 (ITGB5, Accession XM\_003029). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB5. KIAA1434 (Accession XM\_045585) is another VGAM1806 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34493, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60209] Another function of VGAM1806 is therefore inhibition of

KIAA1434 (Accession XM\_045585). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1434. KIAA1751 (Accession XM\_049768) is another VGAM1806 host target gene. KIAA1751 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1751 BINDING SITE, designated SEQ ID:35498, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60210] Another function of VGAM1806 is therefore inhibition of KIAA1751 (Accession XM\_049768). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1751. KIAA1854 (Accession XM\_049884) is another VGAM1806 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35539, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60211] Another function of VGAM1806 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. MAWBP (Accession NM\_022129) is another VGAM1806 host target gene. MAWBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAWBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAWBP BINDING SITE, designated SEQ ID:22683, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60212] Another function of VGAM1806 is therefore inhibition of MAWBP (Accession NM\_022129). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAWBP. Protein Phosphatase 1A (formerly 2C), Magne-

sium-dependent, Alpha Isoform (PPM1A, Accession NM\_021003) is another VGAM1806 host target gene. PPM1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPM1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPM1A BINDING SITE, designated SEQ ID:22000, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60213] Another function of VGAM1806 is therefore inhibition of Protein Phosphatase 1A (formerly 2C), Magnesium-dependent, Alpha Isoform (PPM1A, Accession NM\_021003). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1A. STIP-1 (Accession XM\_045694) is another VGAM1806 host target gene. STIP-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STIP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIP-1 BIND-

ING SITE, designated SEQ ID:34528, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60214] Another function of VGAM1806 is therefore inhibition of STIP-1 (Accession XM\_045694). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIP-1. TEB4 (Accession XM\_027156) is another VGAM1806 host target gene. TEB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEB4 BINDING SITE, designated SEQ ID:30430, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60215] Another function of VGAM1806 is therefore inhibition of TEB4 (Accession XM\_027156). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEB4. ZW10 Interactor (ZWINT, Accession NM\_032997) is another VGAM1806 host target gene. ZWINT BINDING SITE1

and ZWINT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZWINT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZWINT BINDING SITE1 and ZWINT BINDING SITE2, designated SEQ ID:26876 and SEQ ID:13923 respectively, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60216] Another function of VGAM1806 is therefore inhibition of ZW10 Interactor (ZWINT, Accession NM\_032997). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZWINT. LOC220573 (Accession XM\_045569) is another VGAM1806 host target gene. LOC220573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220573 BINDING SITE, designated SEQ ID:34485, to the nucleotide sequence of VGAM1806 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4517.

[60217] Another function of VGAM1806 is therefore inhibition of LOC220573 (Accession XM\_045569). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220573. LOC256073 (Accession XM\_172972) is another VGAM1806 host target gene. LOC256073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256073 BINDING SITE, designated SEQ ID:46230, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60218] Another function of VGAM1806 is therefore inhibition of LOC256073 (Accession XM\_172972). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256073. LOC92606 (Accession XM\_046097) is another VGAM1806 host target gene. LOC92606 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92606, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92606 BINDING SITE, designated SEQ ID:34680, to the nucleotide sequence of VGAM1806 RNA, herein designated VGAM RNA, also designated SEQ ID:4517.

[60219] Another function of VGAM1806 is therefore inhibition of LOC92606 (Accession XM\_046097). Accordingly, utilities of VGAM1806 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92606. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1807 (VGAM1807) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60220] VGAM1807 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1807 was detected is described hereinabove with reference to Figs. 1-8.

[60221] VGAM1807 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus.

VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60222] VGAM1807 gene encodes a VGAM1807 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1807 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1807 precursor RNA is designated SEQ ID:1793, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1793 is located at position 16749 relative to the genome of Rana Tigrina Ranavirus.

[60223] VGAM1807 precursor RNA folds onto itself, forming VGAM1807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60224] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1807 folded precursor RNA into VGAM1807 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1807 RNA is designated SEQ ID:4518, and is provided hereinbelow with reference to the sequence listing part.

[60225] VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1807 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60226] VGAM1807 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1807 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1807 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60227] The complementary binding of VGAM1807 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1807 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1807 host target RNA into VGAM1807 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60228] It is appreciated that VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1807 host target genes. The mRNA of each one of this plurality of VGAM1807 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1807 RNA, herein designated VGAM RNA, and which when bound by VGAM1807 RNA causes inhibition of translation of respective one or more VGAM1807 host target proteins.

[60229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1807 gene, herein designated VGAM GENE, on one or more VGAM1807 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60230] It is yet further appreciated that a function of VGAM1807 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1807 correlate with, and may be deduced from, the identity of the host target genes which VGAM1807 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60231] Nucleotide sequences of the VGAM1807 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1807 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1807 are further described hereinbelow with reference to Table 1.

[60232] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1807 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1807 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60233] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1807 gene, herein designated VGAM is inhibition of expression of VGAM1807 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1807 correlate with, and may be deduced from, the identity of the target genes which VGAM1807 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60234] KIAA1013 (Accession XM\_114303) is a VGAM1807 host target gene. KIAA1013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1013 BINDING SITE, designated SEQ ID:42860, to the nucleotide sequence of

VGAM1807 RNA, herein designated VGAM RNA, also designated SEQ ID:4518.

[60235] A function of VGAM1807 is therefore inhibition of KIAA1013 (Accession XM\_114303). Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1013. MGC13007 (Accession NM\_032320) is another VGAM1807 host target gene. MGC13007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13007 BINDING SITE, designated SEQ ID:26122, to the nucleotide sequence of VGAM1807 RNA, herein designated VGAM RNA, also designated SEQ ID:4518.

[60236] Another function of VGAM1807 is therefore inhibition of MGC13007 (Accession NM\_032320). Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13007. PTD012 (Accession NM\_014039) is another VGAM1807 host target gene. PTD012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PTD012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD012 BINDING SITE, designated SEQ ID:15269, to the nucleotide sequence of VGAM1807 RNA, herein designated VGAM RNA, also designated SEQ ID:4518.

[60237] Another function of VGAM1807 is therefore inhibition of PTD012 (Accession NM\_014039). Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD012. Serum/glucocorticoid Regulated Kinase 2 (SGK2, Accession NM\_016276) is another VGAM1807 host target gene. SGK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGK2 BINDING SITE, designated SEQ ID:18399, to the nucleotide sequence of VGAM1807 RNA, herein designated VGAM RNA, also designated SEQ ID:4518.

[60238] Another function of VGAM1807 is therefore inhibition of Serum/glucocorticoid Regulated Kinase 2 (SGK2, Acces-

sion NM\_016276). Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGK2. LOC152559 (Accession XM\_087487) is another VGAM1807 host target gene. LOC152559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152559 BINDING SITE, designated SEQ ID:39286, to the nucleotide sequence of VGAM1807 RNA, herein designated VGAM RNA, also designated SEQ ID:4518.

[60239] Another function of VGAM1807 is therefore inhibition of LOC152559 (Accession XM\_087487). Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152559. LOC90509 (Accession XM\_032209) is another VGAM1807 host target gene. LOC90509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC90509 BINDING SITE, designated SEQ ID:31609, to the nucleotide sequence of VGAM1807 RNA, herein designated VGAM RNA, also designated SEQ ID:4518.

[60240] Another function of VGAM1807 is therefore inhibition of LOC90509 (Accession XM\_032209). Accordingly, utilities of VGAM1807 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90509. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1808 (VGAM1808) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60241] VGAM1808 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1808 was detected is described hereinabove with reference to Figs. 1–8.

[60242] VGAM1808 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[60243] VGAM1808 gene encodes a VGAM1808 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1808 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1808 precursor RNA is designated SEQ ID:1794, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1794 is located at position 27725 relative to the genome of Rana Tigrina Ranavirus.

[60244] VGAM1808 precursor RNA folds onto itself, forming VGAM1808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60245] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1808 folded precursor RNA into VGAM1808 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1808 RNA is designated SEQ ID:4519, and is provided hereinbelow with reference to the sequence listing part.

[60246] VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1808 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60247] VGAM1808 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1808 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1808 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60248] The complementary binding of VGAM1808 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1808 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1808 host target RNA into VGAM1808 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60249] It is appreciated that VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1808 host target genes. The mRNA of each one of this plurality of VGAM1808 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1808 RNA, herein designated VGAM RNA, and which when bound by VGAM1808 RNA causes inhibition of translation of respective one or more VGAM1808 host target proteins.

[60250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1808 gene, herein designated VGAM GENE, on one or more VGAM1808 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60251] It is yet further appreciated that a function of VGAM1808 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1808 correlate with, and may be deduced from, the identity of the host target genes which VGAM1808 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60252] Nucleotide sequences of the VGAM1808 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1808 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1808 are further described hereinbelow with reference to Table 1.

[60253] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1808 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1808 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60254] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1808 gene, herein designated VGAM is inhibition of expression of VGAM1808 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1808 correlate with, and may be deduced from, the identity of the target genes which VGAM1808 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60255] Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_138271) is a VGAM1808 host target gene. ATRX BINDING SITE1 and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ATRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:28684 and SEQ ID:6095

respectively, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60256] A function of VGAM1808 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM\_138271). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004021) is another VGAM1808 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10224, SEQ ID:10236 and SEQ ID:8261 respectively, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60257] Another function of VGAM1808 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker

types) (DMD, Accession NM\_004021), a gene which muscular dystrophy . Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218. Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM\_040709) is another VGAM1808 host target gene. PTGFRN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTGFRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:33362, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60258] Another function of VGAM1808 is therefore inhibition of Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM\_040709), a gene which inhibits the binding of prostaglandin f2-alpha (pgf2- alpha) to its specific fp receptor. Accordingly, utilities of VGAM1808 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN. The function of PTGFRN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Solute Carrier Family 20 (phosphate transporter), Member 1 (SLC20A1, Accession XM\_002217) is another VGAM1808 host target gene. SLC20A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC20A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC20A1 BINDING SITE, designated SEQ ID:29873, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60259] Another function of VGAM1808 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 1 (SLC20A1, Accession XM\_002217), a gene which could be a sodium-phosphate symporter. Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A1. The function of SLC20A1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM608. Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM\_003043) is another VGAM1808 host target gene. SLC6A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A6 BINDING SITE, designated SEQ ID:9003, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60260] Another function of VGAM1808 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM\_003043), a gene which transports taurine and other beta-amino acids like beta-alanine. Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A6. The function of SLC6A6 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM36. Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080) is another VGAM1808 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23513, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60261] Another function of VGAM1808 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM201. Chromosome 20 Open Reading Frame 80

(C20orf80, Accession XM\_037014) is another VGAM1808 host target gene. C20orf80 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf80, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf80 BINDING SITE, designated SEQ ID:32537, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60262] Another function of VGAM1808 is therefore inhibition of Chromosome 20 Open Reading Frame 80 (C20orf80, Accession XM\_037014). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf80. Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385) is another VGAM1808 host target gene. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C5orf4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING

SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:26184 and SEQ ID:18476 respectively, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60263] Another function of VGAM1808 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. FLJ13352 (Accession NM\_024592) is another VGAM1808 host target gene. FLJ13352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13352 BINDING SITE, designated SEQ ID:23828, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60264] Another function of VGAM1808 is therefore inhibition of FLJ13352 (Accession NM\_024592). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13352. FLJ14346 (Accession NM\_025029) is another VGAM1808 host target gene. FLJ14346 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14346 BINDING SITE, designated SEQ ID:24622, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60265] Another function of VGAM1808 is therefore inhibition of FLJ14346 (Accession NM\_025029). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14346. FLJ20073 (Accession NM\_017654) is another VGAM1808 host target gene. FLJ20073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20073 BINDING SITE, designated SEQ ID:19162, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM

RNA, also designated SEQ ID:4519.

[60266] Another function of VGAM1808 is therefore inhibition of FLJ20073 (Accession NM\_017654). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20073. FLJ22378 (Accession NM\_025078) is another VGAM1808 host target gene. FLJ22378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22378 BINDING SITE, designated SEQ ID:24678, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60267] Another function of VGAM1808 is therefore inhibition of FLJ22378 (Accession NM\_025078). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22378. JDD1 (Accession XM\_032515) is another VGAM1808 host target gene. JDD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JDD1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JDD1 BINDING SITE, designated SEQ ID:31670, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60268] Another function of VGAM1808 is therefore inhibition of JDD1 (Accession XM\_032515). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JDD1. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM\_029962) is another VGAM1808 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30972, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60269] Another function of VGAM1808 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Ac-

cession XM\_029962). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KIAA0285 (Accession NM\_014807) is another VGAM1808 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16746, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60270] Another function of VGAM1808 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA1764 (Accession XM\_045086) is another VGAM1808 host target gene. KIAA1764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1764 BINDING SITE, designated SEQ ID:34353, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60271] Another function of VGAM1808 is therefore inhibition of KIAA1764 (Accession XM\_045086). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1764. MGC2941 (Accession NM\_024297) is another VGAM1808 host target gene. MGC2941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2941 BINDING SITE, designated SEQ ID:23577, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60272] Another function of VGAM1808 is therefore inhibition of MGC2941 (Accession NM\_024297). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2941. moblak (Accession NM\_130807) is another

VGAM1808 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28305, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60273] Another function of VGAM1808 is therefore inhibition of moblak (Accession NM\_130807). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. MSP (Accession NM\_032046) is another VGAM1808 host target gene. MSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSP BINDING SITE, designated SEQ ID:25760, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60274] Another function of VGAM1808 is therefore inhibition of MSP (Accession NM\_032046). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSP. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702) is another VGAM1808 host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:34260, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60275] Another function of VGAM1808 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM\_021815) is another VGAM1808 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22387, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60276] Another function of VGAM1808 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM\_021815). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7. LOC147514 (Accession XM\_041564) is another VGAM1808 host target gene. LOC147514 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147514 BINDING SITE, designated SEQ ID:33548, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60277] Another function of VGAM1808 is therefore inhibition of LOC147514 (Accession XM\_041564). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147514. LOC157657 (Accession XM\_088352) is another VGAM1808 host target gene. LOC157657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157657 BINDING SITE, designated SEQ ID:39629, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60278] Another function of VGAM1808 is therefore inhibition of LOC157657 (Accession XM\_088352). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157657. LOC219347 (Accession XM\_167564) is another VGAM1808 host target gene. LOC219347 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219347, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219347 BINDING SITE, designated SEQ ID:44677, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60279] Another function of VGAM1808 is therefore inhibition of LOC219347 (Accession XM\_167564). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219347. LOC221692 (Accession XM\_166420) is another VGAM1808 host target gene. LOC221692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221692 BINDING SITE, designated SEQ ID:44295, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60280] Another function of VGAM1808 is therefore inhibition of LOC221692 (Accession XM\_166420). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221692. LOC63923 (Accession XM\_040527) is another VGAM1808 host target gene. LOC63923 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC63923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63923 BINDING SITE, designated SEQ ID:33322, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60281] Another function of VGAM1808 is therefore inhibition of LOC63923 (Accession XM\_040527). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63923. LOC90342 (Accession XM\_031009) is another VGAM1808 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31255, to the nucleotide sequence of VGAM1808 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4519.

[60282] Another function of VGAM1808 is therefore inhibition of LOC90342 (Accession XM\_031009). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. LOC92465 (Accession XM\_045250) is another VGAM1808 host target gene. LOC92465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92465 BINDING SITE, designated SEQ ID:34392, to the nucleotide sequence of VGAM1808 RNA, herein designated VGAM RNA, also designated SEQ ID:4519.

[60283] Another function of VGAM1808 is therefore inhibition of LOC92465 (Accession XM\_045250). Accordingly, utilities of VGAM1808 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1809 (VGAM1809) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60284] VGAM1809 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1809 was detected is described hereinabove with reference to Figs. 1–8.

[60285] VGAM1809 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rana Tigrina Ranavirus. VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60286] VGAM1809 gene encodes a VGAM1809 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1809 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1809 precursor RNA is designated SEQ ID:1795, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1795 is located at position 28383 relative to the genome of Rana Tigrina Ranavirus.

[60287] VGAM1809 precursor RNA folds onto itself, forming

VGAM1809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60288] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1809 folded precursor RNA into VGAM1809 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1809 RNA is designated SEQ ID:4520, and is provided hereinbelow with reference to the sequence listing part.

[60289] VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1809 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60290] VGAM1809 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1809 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1809 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60291] The complementary binding of VGAM1809 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1809 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1809 host target RNA into VGAM1809 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60292] It is appreciated that VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1809 host target genes. The mRNA of each one of this plurality of VGAM1809 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1809 RNA, herein designated VGAM RNA, and which when bound by VGAM1809 RNA causes inhibition of translation of respective one or more VGAM1809 host target proteins.

[60293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1809 gene, herein designated VGAM GENE, on one or more VGAM1809 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60294] It is yet further appreciated that a function of VGAM1809 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1809 include diagnosis, prevention and treatment of viral infection by Rana Tigrina Ranavirus. Specific functions, and accordingly utilities, of VGAM1809 correlate with, and may be deduced from, the identity of the host target genes which VGAM1809 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[60295] Nucleotide sequences of the VGAM1809 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1809 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1809 are further described hereinbelow with reference to Table 1.

[60296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1809 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1809 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60297] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1809 gene, herein designated VGAM is inhibition of expression of VGAM1809 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1809 correlate with, and may be deduced from, the identity of the target genes which VGAM1809 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[60298] Telomerase-associated Protein 1 (TEP1, Accession NM\_007110) is a VGAM1809 host target gene. TEP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEP1 BINDING SITE, designated SEQ ID:13975, to the nucleotide sequence of VGAM1809 RNA, herein designated VGAM RNA, also designated SEQ ID:4520.

[60299] A function of VGAM1809 is therefore inhibition of Telomerase-associated Protein 1 (TEP1, Accession NM\_007110), a gene which interacts with active telomerase RNA. Accordingly, utilities of VGAM1809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEP1. The function of TEP1 has been established by previous studies. The telomerase ribonucleoprotein (OMIM Ref. No. 187270) catalyzes the addition of new telomeres on the chromosome ends. Harrington et al. (1997) noted that in humans, the telomeric repeat is 5-prime-TTAGGG-3-prime and the telomerase RNA contains a sequence complementary to this telomeric repeat.

The telomerase RNA template is required for telomere repeat synthesis in vitro and in vivo. The ribonucleoprotein complex responsible for telomerase activity had been purified only in ciliates. Purified tetrahymena telomerase contains an RNA and 2 protein components, p80 and p95. The p80 component can be specifically cross linked to telomerase RNA, whereas the p95 component binds and cross links to single-stranded, telomeric DNA. Harrington et al. (1997) identified a cDNA encoding a tetrahymena p80 homolog from a murine colonic crypt expressed sequence tag (EST) database. The mouse sequence was used as a probe to identify contiguous human cDNA clones from a library prepared from a human colon carcinoma cell line. The mouse and human open reading frames were found to be 75% identical at the amino acid level. The predicted human polypeptide contains 2,627 amino acids, 2 fewer than the predicted mouse polypeptide. Northern blot analysis of both mouse and human tissues showed widespread expression of the gene, which they symbolized TP1. The studies indicated that telomerase-associated proteins are conserved from ciliates to humans. Saito et al. (1997) mapped the human TEP1 gene and mouse Tep1 gene by fluorescence in situ hybridization to human

chromosome 14q11.2 and to the C2–D1 band of mouse chromosome 14, respectively. By means of genetic linkage mapping, the mouse gene was further localized to a position 2.7 cM distal to D14Mit18 and D14Mit134, and 2.0 cM proximal to D14Mit5 on mouse chromosome 14, where conserved linkage homology with human chromosome 14q11–q12 had been identified.

[60300] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60301] Harrington, L.; McPhail, T.; Mar, V.; Zhou, W.; Oulton, R.; Bass, M. B.; Arruda, I.; Robinson, M. O. : A mammalian telomerase–associated protein. *Science* 275: 973–976, 1997. ; and

[60302] Saito, T.; Matsuda, Y.; Suzuki, T.; Hayashi, A.; Yuan, X.; Saito, M.; Nakayama, J.; Hori, T.; Ishikawa, F. : Comparative gene mapping of the human and mouse TEP1 genes, which encode one.

[60303] Further studies establishing the function and utilities of TEP1 are found in John Hopkins OMIM database record ID 601686, and in cited publications numbered 6227–6228 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein

265 (ZNF265, Accession NM\_005455) is another VGAM1809 host target gene. ZNF265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF265 BINDING SITE, designated SEQ ID:11937, to the nucleotide sequence of VGAM1809 RNA, herein designated VGAM RNA, also designated SEQ ID:4520.

[60304] Another function of VGAM1809 is therefore inhibition of Zinc Finger Protein 265 (ZNF265, Accession NM\_005455). Accordingly, utilities of VGAM1809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF265. LOC147837 (Accession XM\_085915) is another VGAM1809 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:38395, to the nucleotide sequence of

VGAM1809 RNA, herein designated VGAM RNA, also designated SEQ ID:4520.

[60305] Another function of VGAM1809 is therefore inhibition of LOC147837 (Accession XM\_085915). Accordingly, utilities of VGAM1809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. LOC221656 (Accession XM\_166418) is another VGAM1809 host target gene. LOC221656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221656 BINDING SITE, designated SEQ ID:44293, to the nucleotide sequence of VGAM1809 RNA, herein designated VGAM RNA, also designated SEQ ID:4520.

[60306] Another function of VGAM1809 is therefore inhibition of LOC221656 (Accession XM\_166418). Accordingly, utilities of VGAM1809 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221656. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1810 (VGAM1810) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60307] VGAM1810 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1810 was detected is described hereinabove with reference to Figs. 1–8.

[60308] VGAM1810 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60309] VGAM1810 gene encodes a VGAM1810 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1810 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1810 precursor RNA is designated SEQ ID:1796, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1796 is located at position 128214 relative to the genome of Equine Herpesvirus 1.

[60310] VGAM1810 precursor RNA folds onto itself, forming VGAM1810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60311] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1810 folded precursor RNA into VGAM1810 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1810 RNA is designated SEQ ID:4521, and is provided hereinbelow with reference to the sequence listing part.

[60312] VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1810 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1810 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60313] VGAM1810 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1810 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1810 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60314] The complementary binding of VGAM1810 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1810 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1810 host target RNA into VGAM1810 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60315] It is appreciated that VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1810 host target genes. The mRNA of each one of this plurality of VGAM1810 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1810 RNA, herein designated VGAM RNA, and which when bound by VGAM1810 RNA causes inhibition of translation of respective one or more VGAM1810 host target proteins.

[60316] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1810 gene, herein designated VGAM GENE, on one or more VGAM1810 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60317] It is yet further appreciated that a function of VGAM1810 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1810 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1810 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60318] Nucleotide sequences of the VGAM1810 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1810 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1810 are further described hereinbelow with reference to Table 1.

[60319] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1810 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1810 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60320] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1810 gene, herein designated VGAM is inhibition of expression of VGAM1810 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1810 correlate with, and may be deduced from, the identity of the target genes which VGAM1810

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60321] Inositol Hexaphosphate Kinase 1 (IHPK1, Accession XM\_171045) is a VGAM1810 host target gene. IHPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IHPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK1 BINDING SITE, designated SEQ ID:45823, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60322] A function of VGAM1810 is therefore inhibition of Inositol Hexaphosphate Kinase 1 (IHPK1, Accession XM\_171045), a gene which is a messenger molecule that releases calcium from intracellular stores. Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK1. The function of IHPK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1061. Ring Finger Protein 26 (RNF26, Accession NM\_032015) is another VGAM1810 host target gene.

RNF26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF26 BINDING SITE, designated SEQ ID:25728, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60323] Another function of VGAM1810 is therefore inhibition of Ring Finger Protein 26 (RNF26, Accession NM\_032015). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF26. FLJ10898 (Accession XM\_002486) is another VGAM1810 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29892, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ

ID:4521.

[60324] Another function of VGAM1810 is therefore inhibition of FLJ10898 (Accession XM\_002486). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. KIAA1550 (Accession XM\_039393) is another VGAM1810 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33070, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60325] Another function of VGAM1810 is therefore inhibition of KIAA1550 (Accession XM\_039393). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282) is another VGAM1810 host target gene. UHRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by UHRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF1 BINDING SITE, designated SEQ ID:14951, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60326] Another function of VGAM1810 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF1. Ubiquitin Specific Protease 20 (USP20, Accession NM\_006676) is another VGAM1810 host target gene. USP20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP20 BINDING SITE, designated SEQ ID:13502, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60327] Another function of VGAM1810 is therefore inhibition of Ubiquitin Specific Protease 20 (USP20, Accession NM\_006676). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP20. LOC147299 (Accession XM\_085763) is another VGAM1810 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38331, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60328] Another function of VGAM1810 is therefore inhibition of LOC147299 (Accession XM\_085763). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147299. LOC255189 (Accession XM\_172929) is another VGAM1810 host target gene. LOC255189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255189, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255189 BINDING SITE, designated SEQ ID:46193, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60329] Another function of VGAM1810 is therefore inhibition of LOC255189 (Accession XM\_172929). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255189. LOC257476 (Accession XM\_028610) is another VGAM1810 host target gene. LOC257476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257476 BINDING SITE, designated SEQ ID:30715, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60330] Another function of VGAM1810 is therefore inhibition of LOC257476 (Accession XM\_028610). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257476. LOC90917 (Accession XM\_034861) is another VGAM1810 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32167, to the nucleotide sequence of VGAM1810 RNA, herein designated VGAM RNA, also designated SEQ ID:4521.

[60331] Another function of VGAM1810 is therefore inhibition of LOC90917 (Accession XM\_034861). Accordingly, utilities of VGAM1810 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1811 (VGAM1811) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60332] VGAM1811 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1811 was detected is described hereinabove with reference to Figs. 1–8.

[60333] VGAM1811 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60334] VGAM1811 gene encodes a VGAM1811 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1811 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1811 precursor RNA is designated SEQ ID:1797, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1797 is located at position 132691 relative to the genome of Equine Herpesvirus 1.

[60335] VGAM1811 precursor RNA folds onto itself, forming VGAM1811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60336] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1811 folded precursor RNA into VGAM1811 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1811 RNA is designated SEQ ID:4522, and is provided hereinbelow with reference to the sequence listing part.

[60337] VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1811 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60338] VGAM1811 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1811 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1811 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60339] The complementary binding of VGAM1811 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1811 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1811 host target RNA into VGAM1811 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60340] It is appreciated that VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1811 host target genes. The mRNA of each one of this plurality of VGAM1811 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1811 RNA, herein designated VGAM RNA, and which when bound by VGAM1811 RNA causes inhibition of translation of respective one or more VGAM1811 host target proteins.

[60341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1811 gene, herein designated VGAM GENE, on one or more VGAM1811 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60342] It is yet further appreciated that a function of VGAM1811 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1811 correlate with, and may be deduced from, the identity of the host target genes which VGAM1811 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60343] Nucleotide sequences of the VGAM1811 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1811 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1811 are further described hereinbelow with reference to Table 1.

[60344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1811 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1811 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60345] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1811 gene, herein designated VGAM is inhibition of expression of VGAM1811 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1811 correlate with, and may be deduced from, the identity of the target genes which VGAM1811 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60346] Complement Component 7 (C7, Accession NM\_000587) is a VGAM1811 host target gene. C7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by C7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7 BINDING SITE, designated SEQ ID:6190, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60347] A function of VGAM1811 is therefore inhibition of Complement Component 7 (C7, Accession NM\_000587). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7. Cholecystokinin A Receptor (CCKAR, Accession NM\_000730) is another VGAM1811 host target gene. CCKAR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCKAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCKAR BINDING SITE, designated SEQ ID:6389, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60348] Another function of VGAM1811 is therefore inhibition of

Cholecystokinin A Receptor (CCKAR, Accession NM\_000730), a gene which Cholecystokinin A receptor, a G protein-coupled receptor; regulates gallbladder contraction and secretion of pancreatic enzymes. Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCKAR. The function of CCKAR has been established by previous studies. The cholecystokinin (CCK) family of peptide hormones (see OMIM Ref. No. 118440) have been implicated in numerous important physiologic events. These appear to be mediated through 2 general classes of receptors, A and B, based on their binding affinities for CCK/gastrin family peptides. Boden et al. (1995) compared the biologic and molecular properties of CCKA and CCKB (OMIM Ref. No. 118445) receptors. Ulrich et al. (1993) noted that, through binding to class A receptors, CCK is a major physiologic mediator of gallbladder contraction and pancreatic enzyme secretion. It appears to play a role in slowing gastric emptying, relaxation of the sphincter of Oddi, and potentiation of insulin secretion. Further, it has been implicated as a mediator of pancreatic growth and tumorigenesis. Class A receptors have also been described in the anterior pituitary, myenteric plexus,

and regions of the central nervous system, where they have been implicated in the pathogenesis of feeding disorders, Parkinson disease, schizophrenia, and drug addiction. Animal model experiments lend further support to the function of CCKAR. ANIMAL MODEL Funakoshi et al. (1995) found a defect in expression of the CCKAR gene in both the fetal and the adult pancreas of a strain of rats (OLETF). They proposed these rats as a useful model for determining CCK receptor function.

[60349] It is appreciated that the abovementioned animal model for CCKAR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[60350] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60351] Ulrich, C. D.; Ferber, I.; Holicky, E.; Hadac, E.; Buell, G.; Miller, L. J. : Molecular cloning and functional expression of the human gallbladder cholecystokinin A receptor. Biochem. Biophys. Res. Commun. 193: 204-211, 1993. ; and

[60352] Funakoshi, A.; Miyasaka, K.; Shinozaki, H.; Masuda, M.; Kawanami, T.; Takata, Y.; Kono, A. : An animal model of

congenital defect of gene expression of cholecystokinin (CCK)–A receptor.

[60353] Further studies establishing the function and utilities of CCKAR are found in John Hopkins OMIM database record ID 118444, and in cited publications numbered 336–345 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interferon, Omega 1 (IFNW1, Accession NM\_002177) is another VGAM1811 host target gene. IFNW1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IFNW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFNW1 BINDING SITE, designated SEQ ID:7936, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60354] Another function of VGAM1811 is therefore inhibition of Interferon, Omega 1 (IFNW1, Accession NM\_002177), a gene which may regulate antiviral defence, cell growth, and immune activation. Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFNW1.

The function of IFNW1 has been established by previous studies. Henco et al. (1985) compiled partial maps of the interferon gene cluster located on 9p21. These maps showed that members of the 2 main families of genes in the IFN superfamily, interferon- $\alpha$  (OMIM Ref. No. 147660) and interferon- $\omega$  (IFNW), are interspersed. Olopade et al. (1992) studied the deletions of the short arm of chromosome 9 frequently observed in acute lymphoblastic leukemia and in gliomas. These deletions often include the entire interferon gene cluster, which comprises about 26 IFNA, IFNW, and IFNB1 (OMIM Ref. No. 147640) genes, as well as the gene for methylthioadenosine phosphorylase (MTAP; 156540). By comparing microscopic deletions with the genes lost at the molecular level, Olopade et al. (1992) determined the order of these genes on 9p to be tel--IFNB1--IFNA/IFNW cluster--MTAP--cen. In a few cell lines and in primary leukemia cells, they observed deletions that had breakpoints within the IFN gene cluster and resulted in partial loss of the IFN genes. These partial deletions allowed them to determine the order of some genes or groups of genes in the IFNA/IFNW gene cluster. From their deletion analysis, Olopade et al. (1992) deduced the following order of the IFN gene on 9p: pter-

--IFNB1--(IFNW1, IFNA21)--IFNWP15--IFNA4--IFNW9--IFNA7--IFNA10--IFNWP18--IFNAP16--IFNA17--IFNA14--(IFNA22, IFNA5, IFNAP20, IFNA6, IFNA13, IFNA2)--(IFNA8, IFNW2, IFNWP19, IFNA1)--MTAP--cen. The genes within the large linkage group are arranged in tandem with their 3-prime end pointing toward the telomere of the short arm. Thus, at least 2 functional interferon-omega genes, IFNW1 and IFNW2, were mapped and several IFNW pseudogenes, e.g., IFNWP15, were localized

[60355] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60356] Olopade, O. I.; Bohlander, S. K.; Pomykala, H.; Maltepe, E.; Van Melle, E.; Le Beau, M. M.; Diaz, M. O. : Mapping of the shortest region of overlap of deletions of the short arm of chromosome 9 associated with human neoplasia. *Genomics* 14: 437-443, 1992. ; and

[60357] Diaz, M. O.; Bohlander, S. : Nomenclature of the human interferon genes. *J. Interferon Res.* 13: 443-444, 1993.

[60358] Further studies establishing the function and utilities of IFNW1 are found in John Hopkins OMIM database record ID 147553, and in cited publications numbered

4473–4475 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Like-glycosyltransferase (LARGE, Accession NM\_004737) is another VGAM1811 host target gene. LARGE BINDING SITE1 and LARGE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LARGE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE1 and LARGE BINDING SITE2, designated SEQ ID:11129 and SEQ ID:28601 respectively, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60359] Another function of VGAM1811 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NM\_004737), a gene which is a member of the N-acetylglucosaminyltransferase family. Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE. The function of LARGE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM205. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM\_022442) is another VGAM1811 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:22763, SEQ ID:9364 and SEQ ID:25510 respectively, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60360] Another function of VGAM1811 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM\_022442), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155. DnaJ (Hsp40) Homolog, Subfamily C, Member 5

(DNAJC5, Accession XM\_028966) is another VGAM1811 host target gene. DNAJC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC5 BINDING SITE, designated SEQ ID:30810, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60361] Another function of VGAM1811 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM\_028966). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC5. KIAA0367 (Accession XM\_041018) is another VGAM1811 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33420, to the

nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60362] Another function of VGAM1811 is therefore inhibition of KIAA0367 (Accession XM\_041018). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. MGC12538 (Accession NM\_032746) is another VGAM1811 host target gene. MGC12538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12538 BINDING SITE, designated SEQ ID:26481, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60363] Another function of VGAM1811 is therefore inhibition of MGC12538 (Accession NM\_032746). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12538. Protocadherin 10 (PCDH10, Accession NM\_032961) is another VGAM1811 host target gene. PCDH10 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by PCDH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:26766, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60364] Another function of VGAM1811 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM\_032961). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. Phosphodiesterase 1C, Calmodulin-dependent 70kDa (PDE1C, Accession NM\_005020) is another VGAM1811 host target gene. PDE1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE1C BINDING SITE, designated SEQ ID:11460, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60365] Another function of VGAM1811 is therefore inhibition of Phosphodiesterase 1C, Calmodulin-dependent 70kDa (PDE1C, Accession NM\_005020). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE1C. STATI2 (Accession XM\_170547) is another VGAM1811 host target gene. STATI2 BINDING SITE1 and STATI2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STATI2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STATI2 BINDING SITE1 and STATI2 BINDING SITE2, designated SEQ ID:45368 and SEQ ID:9957 respectively, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60366] Another function of VGAM1811 is therefore inhibition of STATI2 (Accession XM\_170547). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STATI2. LOC152059 (Accession XM\_087372) is another VGAM1811 host target gene. LOC152059 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC152059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152059 BINDING SITE, designated SEQ ID:39207, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60367] Another function of VGAM1811 is therefore inhibition of LOC152059 (Accession XM\_087372). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152059. LOC157507 (Accession XM\_088312) is another VGAM1811 host target gene. LOC157507 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:39605, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60368] Another function of VGAM1811 is therefore inhibition of LOC157507 (Accession XM\_088312). Accordingly, utilities

of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157507. LOC157697 (Accession XM\_088365) is another VGAM1811 host target gene. LOC157697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157697 BINDING SITE, designated SEQ ID:39645, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60369] Another function of VGAM1811 is therefore inhibition of LOC157697 (Accession XM\_088365). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157697. LOC201252 (Accession XM\_113941) is another VGAM1811 host target gene. LOC201252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201252 BINDING SITE, designated SEQ ID:42556, to the nucleotide sequence of VGAM1811 RNA, herein designated VGAM RNA, also designated SEQ ID:4522.

[60370] Another function of VGAM1811 is therefore inhibition of LOC201252 (Accession XM\_113941). Accordingly, utilities of VGAM1811 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1812 (VGAM1812) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60371] VGAM1812 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1812 was detected is described hereinabove with reference to Figs. 1–8.

[60372] VGAM1812 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60373] VGAM1812 gene encodes a VGAM1812 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1812 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1812 precursor RNA is designated SEQ ID:1798, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1798 is located at position 129486 relative to the genome of Equine Herpesvirus 1.

[60374] VGAM1812 precursor RNA folds onto itself, forming VGAM1812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60375] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1812 folded precursor RNA into VGAM1812 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1812 RNA is designated SEQ ID:4523, and is provided hereinbelow with reference to the sequence listing part.

[60376] VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1812 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60377] VGAM1812 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1812 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1812 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60378] The complementary binding of VGAM1812 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1812 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1812 host target RNA into VGAM1812 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60379] It is appreciated that VGAM1812 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1812 host target genes. The mRNA of each one of this plurality of VGAM1812 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1812 RNA, herein designated VGAM RNA, and which when bound by VGAM1812 RNA causes inhibition of translation of respective one or more VGAM1812 host target proteins.

[60380] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1812 gene, herein designated VGAM GENE, on one or more VGAM1812 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[60381] It is yet further appreciated that a function of VGAM1812 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1812 correlate with, and may be deduced from, the identity of the host target genes which VGAM1812 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60382] Nucleotide sequences of the VGAM1812 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1812 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1812 are further described hereinbelow with reference to Table 1.

[60383] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1812 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1812 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60384] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1812 gene, herein designated VGAM is inhibition of expression of VGAM1812 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1812 correlate with, and may be deduced from, the identity of the target genes which VGAM1812 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60385] Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007301) is a VGAM1812 host target gene. BRCA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRCA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE, designated SEQ ID:14202, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60386] A function of VGAM1812 is therefore inhibition of Breast

Cancer 1, Early Onset (BRCA1, Accession NM\_007301). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Guanine Nucleotide Binding Protein (G protein), Alpha Activating Activity Polypeptide O (GNAO1, Accession XM\_165653) is another VGAM1812 host target gene. GNAO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAO1 BINDING SITE, designated SEQ ID:43718, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60387] Another function of VGAM1812 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Activating Activity Polypeptide O (GNAO1, Accession XM\_165653), a gene which functions as modulators or transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAO1. The function of GNAO1 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM\_032104) is another VGAM1812 host target gene. PPP1R12B BINDING SITE1 and PPP1R12B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R12B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE1 and PPP1R12B BINDING SITE2, designated SEQ ID:25796 and SEQ ID:25794 respectively, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60388] Another function of VGAM1812 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM\_032104). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12B. FLJ10922 (Accession NM\_018273) is another VGAM1812 host target gene. FLJ10922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ10922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:20255, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60389] Another function of VGAM1812 is therefore inhibition of FLJ10922 (Accession NM\_018273). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922. FLJ12876 (Accession NM\_022754) is another VGAM1812 host target gene. FLJ12876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12876 BINDING SITE, designated SEQ ID:22986, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60390] Another function of VGAM1812 is therefore inhibition of FLJ12876 (Accession NM\_022754). Accordingly, utilities of

VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12876. KIAA1582 (Accession XM\_037262) is another VGAM1812 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32579, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60391] Another function of VGAM1812 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM\_138714) is another VGAM1812 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:28953, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60392] Another function of VGAM1812 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM\_138714). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. LOC151568 (Accession NM\_138483) is another VGAM1812 host target gene. LOC151568 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151568 BINDING SITE, designated SEQ ID:28837, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60393] Another function of VGAM1812 is therefore inhibition of LOC151568 (Accession NM\_138483). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151568. LOC199986 (Accession XM\_117168) is another VGAM1812 host target gene. LOC199986 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199986 BINDING SITE, designated SEQ ID:43271, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60394] Another function of VGAM1812 is therefore inhibition of LOC199986 (Accession XM\_117168). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199986. LOC255057 (Accession XM\_170903) is another VGAM1812 host target gene. LOC255057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255057 BINDING SITE, designated SEQ ID:45660, to the nucleotide sequence of VGAM1812 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4523.

[60395] Another function of VGAM1812 is therefore inhibition of LOC255057 (Accession XM\_170903). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255057. LOC91801 (Accession NM\_138775) is another VGAM1812 host target gene. LOC91801 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91801 BINDING SITE, designated SEQ ID:29009, to the nucleotide sequence of VGAM1812 RNA, herein designated VGAM RNA, also designated SEQ ID:4523.

[60396] Another function of VGAM1812 is therefore inhibition of LOC91801 (Accession NM\_138775). Accordingly, utilities of VGAM1812 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91801. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1813 (VGAM1813) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60397] VGAM1813 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1813 was detected is described hereinabove with reference to Figs. 1–8.

[60398] VGAM1813 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60399] VGAM1813 gene encodes a VGAM1813 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1813 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1813 precursor RNA is designated SEQ ID:1799, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1799 is located at position 137114 relative to the genome of Equine Herpesvirus 1.

[60400] VGAM1813 precursor RNA folds onto itself, forming

VGAM1813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60401] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1813 folded precursor RNA into VGAM1813 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1813 RNA is designated SEQ ID:4524, and is provided hereinbelow with reference to the sequence listing part.

[60402] VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1813 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[60403] VGAM1813 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1813 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1813 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60404] The complementary binding of VGAM1813 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1813 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1813 host target RNA into VGAM1813 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60405] It is appreciated that VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1813 host target genes. The mRNA of each one of this plurality of VGAM1813 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1813 RNA, herein designated VGAM RNA, and which when bound by VGAM1813 RNA causes inhibition of translation of respective one or more VGAM1813 host target proteins.

[60406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1813 gene, herein designated VGAM GENE, on one or more VGAM1813 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60407] It is yet further appreciated that a function of VGAM1813 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1813 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1813 correlate with, and may be deduced from, the identity of the host target genes which VGAM1813 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[60408] Nucleotide sequences of the VGAM1813 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1813 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1813 are further described hereinbelow with reference to Table 1.

[60409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1813 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1813 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60410] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1813 gene, herein designated VGAM is inhibition of expression of VGAM1813 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1813 correlate with, and may be deduced from, the identity of the target genes which VGAM1813 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[60411] Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM\_001315) is a VGAM1813 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE4, designated SEQ ID:7003, SEQ ID:29107, SEQ ID:29110 and SEQ ID:29114 respectively, to the nucleotide sequence of VGAM1813 RNA, herein designated VGAM RNA, also designated SEQ ID:4524.

[60412] A function of VGAM1813 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM\_001315), a gene which is important for cytokine production; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM1813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM107.KIAA1110 (Accession XM\_029973) is another VGAM1813 host target gene. KIAA1110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1110 BINDING SITE, designated SEQ ID:30982, to the nucleotide sequence of VGAM1813 RNA, herein designated VGAM RNA, also designated SEQ ID:4524.

[60413] Another function of VGAM1813 is therefore inhibition of KIAA1110 (Accession XM\_029973). Accordingly, utilities of VGAM1813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1110. LOC146315 (Accession XM\_027576) is another VGAM1813 host target gene. LOC146315 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146315 BINDING SITE, designated SEQ ID:30533, to

the nucleotide sequence of VGAM1813 RNA, herein designated VGAM RNA, also designated SEQ ID:4524.

[60414] Another function of VGAM1813 is therefore inhibition of LOC146315 (Accession XM\_027576). Accordingly, utilities of VGAM1813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146315. LOC256158 (Accession XM\_175125) is another VGAM1813 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46621, to the nucleotide sequence of VGAM1813 RNA, herein designated VGAM RNA, also designated SEQ ID:4524.

[60415] Another function of VGAM1813 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM1813 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1814 (VGAM1814) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60416] VGAM1814 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1814 was detected is described hereinabove with reference to Figs. 1–8.

[60417] VGAM1814 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60418] VGAM1814 gene encodes a VGAM1814 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1814 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1814 precursor RNA is designated SEQ ID:1800, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1800 is located at position 127841 relative to the genome of Equine Herpesvirus 1.

[60419] VGAM1814 precursor RNA folds onto itself, forming VGAM1814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60420] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1814 folded precursor RNA into VGAM1814 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1814 RNA is designated SEQ ID:4525, and is provided hereinbelow with reference to the sequence listing part.

[60421] VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1814 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1814 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[60422] VGAM1814 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1814 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1814 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60423] The complementary binding of VGAM1814 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1814 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1814 host target RNA into VGAM1814 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60424] It is appreciated that VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1814 host target genes. The mRNA of each one of this plurality of VGAM1814 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1814 RNA, herein designated VGAM RNA, and which when bound by VGAM1814 RNA causes inhibition of translation of respective one or more VGAM1814 host target proteins.

[60425] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1814 gene, herein designated VGAM GENE, on one or more VGAM1814 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60426] It is yet further appreciated that a function of VGAM1814 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1814 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1814 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1814 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60427] Nucleotide sequences of the VGAM1814 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1814 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1814 are further described hereinbelow with reference to Table 1.

[60428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1814 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1814 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60429] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1814 gene, herein designated VGAM is inhibition of expression of VGAM1814 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1814 correlate with, and may be deduced from, the identity of the target genes which VGAM1814

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60430] KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559) is a VGAM1814 host target gene. KHDRBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KHDRBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KHDRBS1 BINDING SITE, designated SEQ ID:13327, to the nucleotide sequence of VGAM1814 RNA, herein designated VGAM RNA, also designated SEQ ID:4525.

[60431] A function of VGAM1814 is therefore inhibition of KH Domain Containing, RNA Binding, Signal Transduction Associated 1 (KHDRBS1, Accession NM\_006559). Accordingly, utilities of VGAM1814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KHDRBS1. MGC3222 (Accession NM\_024334) is another VGAM1814 host target gene. MGC3222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3222, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3222 BINDING SITE, designated SEQ ID:23641, to the nucleotide sequence of VGAM1814 RNA, herein designated VGAM RNA, also designated SEQ ID:4525.

[60432] Another function of VGAM1814 is therefore inhibition of MGC3222 (Accession NM\_024334). Accordingly, utilities of VGAM1814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3222. PRO2198 (Accession NM\_018621) is another VGAM1814 host target gene. PRO2198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2198 BINDING SITE, designated SEQ ID:20694, to the nucleotide sequence of VGAM1814 RNA, herein designated VGAM RNA, also designated SEQ ID:4525.

[60433] Another function of VGAM1814 is therefore inhibition of PRO2198 (Accession NM\_018621). Accordingly, utilities of VGAM1814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PRO2198. LOC200339 (Accession XM\_117226) is another VGAM1814 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:43299, to the nucleotide sequence of VGAM1814 RNA, herein designated VGAM RNA, also designated SEQ ID:4525.

[60434] Another function of VGAM1814 is therefore inhibition of LOC200339 (Accession XM\_117226). Accordingly, utilities of VGAM1814 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1815 (VGAM1815) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60435] VGAM1815 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1815 was detected is described hereinabove with reference to Figs. 1–8.

[60436] VGAM1815 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60437] VGAM1815 gene encodes a VGAM1815 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1815 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1815 precursor RNA is designated SEQ ID:1801, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1801 is located at position 130995 relative to the genome of Equine Herpesvirus 1.

[60438] VGAM1815 precursor RNA folds onto itself, forming VGAM1815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60439] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1815 folded precursor RNA into VGAM1815 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1815 RNA is designated SEQ ID:4526, and is provided hereinbelow with reference to the sequence listing part.

[60440] VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1815 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60441] VGAM1815 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1815 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1815 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60442] The complementary binding of VGAM1815 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1815 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1815 host target RNA into VGAM1815 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60443] It is appreciated that VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1815 host target genes. The mRNA of each one of this plurality of VGAM1815 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1815 RNA, herein designated VGAM RNA, and which when bound by VGAM1815 RNA causes inhibition of translation of respective one or more VGAM1815 host target proteins.

[60444] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1815 gene, herein designated VGAM GENE, on one or more VGAM1815 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60445] It is yet further appreciated that a function of VGAM1815 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1815 correlate with, and may be deduced from, the identity of the host target genes which VGAM1815 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60446] Nucleotide sequences of the VGAM1815 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1815 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1815 are further described hereinbelow with reference to Table 1.

[60447] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1815 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1815 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60448] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1815 gene, herein designated VGAM is inhibition of expression of VGAM1815 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1815 correlate with, and may be deduced from, the identity of the target genes which VGAM1815 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60449] Engrailed Homolog 1 (EN1, Accession NM\_001426) is a VGAM1815 host target gene. EN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EN1, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN1 BINDING SITE, designated SEQ ID:7139, to the nucleotide sequence of VGAM1815 RNA, herein designated VGAM RNA, also designated SEQ ID:4526.

[60450] A function of VGAM1815 is therefore inhibition of Engrailed Homolog 1 (EN1, Accession NM\_001426), a gene which is a member of the homeodomain family of DNA binding proteins; may regulate gene expression, morphogenesis, and differentiation;. Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN1. The function of EN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1615. Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM\_002372) is another VGAM1815 host target gene. MAN2A1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MAN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MAN2A1 BINDING SITE, designated SEQ ID:8178, to the nucleotide sequence of VGAM1815 RNA, herein designated VGAM RNA, also designated SEQ ID:4526.

[60451] Another function of VGAM1815 is therefore inhibition of Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM\_002372), a gene which catalyzes the final hydrolytic step in the asparagine-linked oligosaccharide (N-glycan) maturation pathway. Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN2A1. The function of MAN2A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1410. Netrin 4 (NTN4, Accession XM\_031896) is another VGAM1815 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31511, to the nucleotide sequence of VGAM1815 RNA, herein

designated VGAM RNA, also designated SEQ ID:4526.

[60452] Another function of VGAM1815 is therefore inhibition of Netrin 4 (NTN4, Accession XM\_031896). Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. Rabip4R (Accession NM\_017987) is another VGAM1815 host target gene. Rabip4R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rabip4R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rabip4R BINDING SITE, designated SEQ ID:19716, to the nucleotide sequence of VGAM1815 RNA, herein designated VGAM RNA, also designated SEQ ID:4526.

[60453] Another function of VGAM1815 is therefore inhibition of Rabip4R (Accession NM\_017987). Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rabip4R. LOC143384 (Accession XM\_084504) is another VGAM1815 host target gene. LOC143384 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143384, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143384 BINDING SITE, designated SEQ ID:37614, to the nucleotide sequence of VGAM1815 RNA, herein designated VGAM RNA, also designated SEQ ID:4526.

[60454] Another function of VGAM1815 is therefore inhibition of LOC143384 (Accession XM\_084504). Accordingly, utilities of VGAM1815 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143384. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1816 (VGAM1816) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60455] VGAM1816 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1816 was detected is described hereinabove with reference to Figs. 1-8.

[60456] VGAM1816 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60457] VGAM1816 gene encodes a VGAM1816 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1816 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1816 precursor RNA is designated SEQ ID:1802, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1802 is located at position 41903 relative to the genome of Camelpox Virus.

[60458] VGAM1816 precursor RNA folds onto itself, forming VGAM1816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60459] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1816 folded precursor RNA into VGAM1816 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1816 RNA is designated SEQ ID:4527, and is provided hereinbelow with reference to the sequence listing part.

[60460] VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1816 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60461] VGAM1816 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1816 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1816 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60462] The complementary binding of VGAM1816 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1816 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1816 host target RNA into VGAM1816 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60463] It is appreciated that VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1816 host target genes. The mRNA of each one of this plurality of VGAM1816 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1816 RNA, herein designated VGAM RNA, and which when bound by VGAM1816 RNA causes inhibition of translation of respective one or more VGAM1816 host target proteins.

[60464] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1816 gene, herein designated VGAM GENE, on one or more VGAM1816 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60465] It is yet further appreciated that a function of VGAM1816 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1816 correlate with, and may be deduced from, the identity of the host target genes which VGAM1816 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60466] Nucleotide sequences of the VGAM1816 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1816 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1816 are further described hereinbelow with reference to Table 1.

[60467] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1816 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1816 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60468] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1816 gene, herein designated VGAM is inhibition of expression of VGAM1816 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1816 correlate with, and may be deduced from, the identity of the target genes which VGAM1816 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60469] Four and A Half LIM Domains 1 (FHL1, Accession NM\_001449) is a VGAM1816 host target gene. FHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHL1 BINDING SITE, designated SEQ ID:7181, to the nu-

cleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60470] A function of VGAM1816 is therefore inhibition of Four and A Half LIM Domains 1 (FHL1, Accession NM\_001449), a gene which may have an involvement in muscle development or hypertrophy. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHL1. The function of FHL1 has been established by previous studies. LIM proteins, named for 'LIN11, ISL1, and MEC3,' are defined by the possession of a highly conserved double zinc finger motif, called the LIM domain. Morgan et al. (1995) identified a partial human SLIM1 cDNA. They found that SLIM1 is a developmentally regulated protein that is expressed in human skeletal muscle but not in a variety of other tissues. By searching sequence databases with the partial SLIM1 cDNA isolated by Morgan et al. (1995), Morgan and Madgwick (1996) identified human cDNAs encoding the complete SLIM1 amino acid sequence. The predicted 280-amino acid protein contains 4 LIM domains and a novel single zinc finger domain in the N-terminal region. By Northern blot analysis, SLIM1 is expressed as a 2.3-kb mRNA in human masseter muscle. By somatic cell

hybrid mapping, fluorescence in situ hybridization, and radiation hybrid mapping, Lee et al. (1998) assigned the FHL1 gene to Xq27.2.

[60471] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60472] Lee, S. M. Y.; Tsui, S. K. W.; Chan, K. K.; Garcia-Barcelo, M.; Waye, M. M. Y.; Fung, K. P.; Liew, C. C.; Lee, C. Y. : Chromosomal mapping, tissue distribution and cDNA sequence of four-and-a-half LIM domain protein 1 (FHL1). Gene 216: 163–170, 1998. ; and

[60473] Morgan, M. J.; Madgwick, A. J.; Charleston, B.; Pell, J. M.; Loughna, P. T. : The developmental regulation of a novel muscle LIM–protein. Biochem. Biophys. Res. Commun. 212: 840–846, 19.

[60474] Further studies establishing the function and utilities of FHL1 are found in John Hopkins OMIM database record ID 300163, and in cited publications numbered 11003–11005 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838) is another VGAM1816 host target gene. GRM1 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by GRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM1 BINDING SITE, designated SEQ ID:6498, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60475] Another function of VGAM1816 is therefore inhibition of Glutamate Receptor, Metabotropic 1 (GRM1, Accession NM\_000838), a gene which promotes phosphoinositide hydrolysis. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM1. The function of GRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM786. Plakophilin 2 (PKP2, Accession NM\_004572) is another VGAM1816 host target gene. PKP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKP2 BINDING

SITE, designated SEQ ID:10915, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60476] Another function of VGAM1816 is therefore inhibition of Plakophilin 2 (PKP2, Accession NM\_004572), a gene which may play a role in junctional plaques. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKP2. The function of PKP2 has been established by previous studies. Plakophilins are armadillo repeat-containing proteins that are localized in the desmosomal plaque and cell nucleus. Desmosomal plakophilins, like plakophilin 2, form part of the link between the cytoplasmic tail of cadherins and the intermediate filament cytoskeleton (Bonne et al., 2000). Mertens et al. (1996) isolated cDNAs encoding 2 forms of plakophilin-2 (PKP2), which they named PKP2a and PKP2b, from human colon carcinoma and heart cDNA libraries. The predicted 837-amino acid PKP2a protein contains 9 complete copies of the armadillo motif, which is an approximately 42-amino acid domain first defined in the *Drosophila* 'armadillo' gene product. Compared with PKP2a, the predicted 881-amino acid PKP2b protein contains an insertion of 44 amino acids between

the second and third armadillo motifs. The authors suggested that PKP2a and PKP2b are derived from alternatively spliced PKP2 transcripts. The PKP2 and PKP1 (OMIM Ref. No. 601975) proteins are 42% identical in the armadillo repeats. Immunoblot analysis of a wide range of human cell lines and tissues using antibodies against PKP2 detected an approximately 100-kD protein, which sometimes appeared as a twin band. Immunolocalization studies showed that PKP2 is a constituent of the desmosomal plaque in simple epithelia, some stratified epithelia, and some nonepithelial cells. PKP2 is also enriched in the karyoplasm of cells of various types, including those lacking desmosomes. Northern blot analysis detected approximately 5.3-kb PKP2 transcripts in diverse human cell lines and tissues representing both epithelial and nonepithelial cells. By fluorescence in situ hybridization and analysis of a somatic cell hybrid mapping panel, Bonne et al. (1998) mapped the PKP2 gene to 12p13. Schmidt et al. (1999) used FISH to map the PKP2 gene to 12p11. Further analysis by Bonne et al. (2000) of a human 12p13-specific PAC clone showed that 12p13 was the location of a processed plakophilin-2 pseudogene, PKP2P1. By fluorescence in situ hybridization, Bonne et al. (2000) confirmed

the localization of PKP2 to 12p11.

[60477] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60478] Bonne, S.; van Hengel, J; van Roy, F. : Assignment of the plakophilin-2 gene (PKP2) and a plakophilin-2 pseudo-gene (PKP2P1) to human chromosome bands 12p11 and 12p13, respectively, by in situ hybridization. Cytogenet. Cell Genet. 88: 286-287, 2000. ; and

[60479] Bonne, S.; van Hengel, J.; van Roy, F. : Chromosomal mapping of human armadillo genes belonging to the p120(ctn)/plakophilin subfamily. Genomics 51: 452-454, 1998.

[60480] Further studies establishing the function and utilities of PKP2 are found in John Hopkins OMIM database record ID 602861, and in cited publications numbered 532 and 7029-5322 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Reticulocalbin 1, EF-hand Calcium Binding Domain (RCN1, Accession XM\_006320) is another VGAM1816 host target gene. RCN1 BINDING SITE1 and RCN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RCN1, corresponding

to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCN1 BINDING SITE1 and RCN1 BINDING SITE2, designated SEQ ID:29996 and SEQ ID:8804 respectively, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60481] Another function of VGAM1816 is therefore inhibition of Reticulocalbin 1, EF-hand Calcium Binding Domain (RCN1, Accession XM\_006320), a gene which may regulate calcium-dependent activities in the ER lumen or post-ER compartment. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCN1. The function of RCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM865. TEM6 (Accession NM\_022748) is another VGAM1816 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TEM6 BINDING SITE, designated SEQ ID:22967, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60482] Another function of VGAM1816 is therefore inhibition of TEM6 (Accession NM\_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.BTB (POZ) Domain Containing 3 (BTBD3, Accession NM\_014962) is another VGAM1816 host target gene. BTBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:17340, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60483] Another function of VGAM1816 is therefore inhibition of

BTB (POZ) Domain Containing 3 (BTBD3, Accession NM\_014962). Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM\_007107) is another VGAM1816 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13969, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60484] Another function of VGAM1816 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM\_007107). Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR3. SUN1 (Accession NM\_025154) is another VGAM1816 host target gene. SUN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by SUN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUN1 BINDING SITE, designated SEQ ID:24794, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60485] Another function of VGAM1816 is therefore inhibition of SUN1 (Accession NM\_025154). Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUN1. LOC125228 (Accession XM\_058913) is another VGAM1816 host target gene. LOC125228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125228 BINDING SITE, designated SEQ ID:36794, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60486] Another function of VGAM1816 is therefore inhibition of LOC125228 (Accession XM\_058913). Accordingly, utilities

of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125228. LOC158563 (Accession XM\_088606) is another VGAM1816 host target gene. LOC158563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:39871, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60487] Another function of VGAM1816 is therefore inhibition of LOC158563 (Accession XM\_088606). Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563. LOC161635 (Accession XM\_172921) is another VGAM1816 host target gene. LOC161635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC161635 BINDING SITE, designated SEQ ID:46188, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60488] Another function of VGAM1816 is therefore inhibition of LOC161635 (Accession XM\_172921). Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161635. LOC257206 (Accession XM\_173136) is another VGAM1816 host target gene. LOC257206 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257206 BINDING SITE, designated SEQ ID:46386, to the nucleotide sequence of VGAM1816 RNA, herein designated VGAM RNA, also designated SEQ ID:4527.

[60489] Another function of VGAM1816 is therefore inhibition of LOC257206 (Accession XM\_173136). Accordingly, utilities of VGAM1816 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1817 (VGAM1817) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60490] VGAM1817 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1817 was detected is described hereinabove with reference to Figs. 1–8.

[60491] VGAM1817 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60492] VGAM1817 gene encodes a VGAM1817 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1817 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1817 precursor RNA is designated SEQ ID:1803, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1803 is located at position 27215 relative to the

genome of Variola Virus.

[60493] VGAM1817 precursor RNA folds onto itself, forming VGAM1817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60494] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1817 folded precursor RNA into VGAM1817 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1817 RNA is designated SEQ ID:4528, and is provided hereinbelow with reference to the sequence listing part.

[60495] VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1817 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[60496] VGAM1817 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1817 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1817 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60497] The complementary binding of VGAM1817 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1817 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1817 host target RNA into VGAM1817 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60498] It is appreciated that VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1817 host target genes. The mRNA of each one of this plurality of VGAM1817 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1817 RNA, herein designated VGAM RNA, and which when bound by VGAM1817 RNA causes inhibition of translation of respective one or more VGAM1817 host target proteins.

[60499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1817 gene, herein designated VGAM GENE, on one or more VGAM1817 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60500] It is yet further appreciated that a function of VGAM1817 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1817 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1817 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60501] Nucleotide sequences of the VGAM1817 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1817 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1817 are further described hereinbelow with reference to Table 1.

[60502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1817 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1817 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60503] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1817 gene, herein designated VGAM is inhibition of expression of VGAM1817 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1817 correlate with, and may be deduced

from, the identity of the target genes which VGAM1817 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60504] Collagen, Type IV, Alpha 4 (COL4A4, Accession NM\_000092) is a VGAM1817 host target gene. COL4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A4 BINDING SITE, designated SEQ ID:5554, to the nucleotide sequence of VGAM1817 RNA, herein designated VGAM RNA, also designated SEQ ID:4528.

[60505] A function of VGAM1817 is therefore inhibition of Collagen, Type IV, Alpha 4 (COL4A4, Accession NM\_000092). Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A4. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332) is another VGAM1817 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27172, to the nucleotide sequence of VGAM1817 RNA, herein designated VGAM RNA, also designated SEQ ID:4528.

[60506] Another function of VGAM1817 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033332). Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. FLJ23120 (Accession XM\_097961) is another VGAM1817 host target gene. FLJ23120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23120 BINDING SITE, designated SEQ ID:41267, to the nucleotide sequence of VGAM1817 RNA, herein designated VGAM RNA, also designated SEQ ID:4528.

[60507] Another function of VGAM1817 is therefore inhibition of

FLJ23120 (Accession XM\_097961). Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23120. KIAA0738 (Accession NM\_014719) is another VGAM1817 host target gene. KIAA0738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0738 BINDING SITE, designated SEQ ID:16277, to the nucleotide sequence of VGAM1817 RNA, herein designated VGAM RNA, also designated SEQ ID:4528.

[60508] Another function of VGAM1817 is therefore inhibition of KIAA0738 (Accession NM\_014719). Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0738. KIAA1239 (Accession XM\_049078) is another VGAM1817 host target gene. KIAA1239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:35341, to the nucleotide sequence of VGAM1817 RNA, herein designated VGAM RNA, also designated SEQ ID:4528.

[60509] Another function of VGAM1817 is therefore inhibition of KIAA1239 (Accession XM\_049078). Accordingly, utilities of VGAM1817 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1239. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1818 (VGAM1818) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60510] VGAM1818 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1818 was detected is described hereinabove with reference to Figs. 1–8.

[60511] VGAM1818 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[60512] VGAM1818 gene encodes a VGAM1818 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1818 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1818 precursor RNA is designated SEQ ID:1804, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1804 is located at position 28707 relative to the genome of Variola Virus.

[60513] VGAM1818 precursor RNA folds onto itself, forming VGAM1818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60514] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1818 folded precursor RNA into VGAM1818 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1818 RNA is designated SEQ ID:4529, and is provided hereinbelow with reference to the sequence listing part.

[60515] VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1818 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60516] VGAM1818 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1818 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1818 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60517] The complementary binding of VGAM1818 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1818 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1818 host target RNA into VGAM1818 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60518] It is appreciated that VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1818 host target genes. The mRNA of each one of this plurality of VGAM1818 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1818 RNA, herein designated VGAM RNA, and which when bound by VGAM1818 RNA causes inhibition of translation of respective one or more VGAM1818 host target proteins.

[60519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1818 gene, herein designated VGAM GENE, on one or more VGAM1818 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60520] It is yet further appreciated that a function of VGAM1818 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1818 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1818 correlate with, and may be deduced from, the identity of the host target genes which VGAM1818 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60521] Nucleotide sequences of the VGAM1818 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1818 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1818 are further described hereinbelow with reference to Table 1.

[60522] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1818 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1818 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60523] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1818 gene, herein designated VGAM is inhibition of expression of VGAM1818 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1818 correlate with, and may be deduced from, the identity of the target genes which VGAM1818 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60524] OSRF (Accession XM\_003724) is a VGAM1818 host target gene. OSRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSRF BINDING SITE, designated SEQ ID:29941, to the nucleotide sequence of VGAM1818 RNA, herein designated VGAM RNA, also designated SEQ ID:4529.

[60525] A function of VGAM1818 is therefore inhibition of OSRF

(Accession XM\_003724). Accordingly, utilities of VGAM1818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSRF. POPX1 (Accession NM\_014906) is another VGAM1818 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17116, to the nucleotide sequence of VGAM1818 RNA, herein designated VGAM RNA, also designated SEQ ID:4529.

[60526] Another function of VGAM1818 is therefore inhibition of POPX1 (Accession NM\_014906). Accordingly, utilities of VGAM1818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. LOC124045 (Accession XM\_071873) is another VGAM1818 host target gene. LOC124045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC124045 BINDING SITE, designated SEQ ID:37439, to the nucleotide sequence of VGAM1818 RNA, herein designated VGAM RNA, also designated SEQ ID:4529.

[60527] Another function of VGAM1818 is therefore inhibition of LOC124045 (Accession XM\_071873). Accordingly, utilities of VGAM1818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124045. LOC150848 (Accession XM\_097959) is another VGAM1818 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41253, to the nucleotide sequence of VGAM1818 RNA, herein designated VGAM RNA, also designated SEQ ID:4529.

[60528] Another function of VGAM1818 is therefore inhibition of LOC150848 (Accession XM\_097959). Accordingly, utilities of VGAM1818 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1819 (VGAM1819) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60529] VGAM1819 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1819 was detected is described hereinabove with reference to Figs. 1–8.

[60530] VGAM1819 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus. VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60531] VGAM1819 gene encodes a VGAM1819 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1819 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1819 precursor RNA is designated SEQ ID:1805, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1805 is located at position 7183 relative to the genome of Cryphonectria Hypovirus.

[60532] VGAM1819 precursor RNA folds onto itself, forming VGAM1819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60533] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1819 folded precursor RNA into VGAM1819 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1819 RNA is designated SEQ ID:4530, and is provided hereinbelow with reference to the sequence listing part.

[60534] VGAM1819 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1819 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60535] VGAM1819 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1819 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1819 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1819 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[60536] The complementary binding of VGAM1819 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1819 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1819 host target RNA into VGAM1819 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60537] It is appreciated that VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1819 host target genes. The mRNA of each one of this plurality of VGAM1819 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1819 RNA, herein designated VGAM RNA, and which when bound by VGAM1819 RNA causes inhibition of translation of respective one or more

VGAM1819 host target proteins.

[60538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1819 gene, herein designated VGAM GENE, on one or more VGAM1819 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60539] It is yet further appreciated that a function of VGAM1819 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1819 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus.

Specific functions, and accordingly utilities, of VGAM1819 correlate with, and may be deduced from, the identity of the host target genes which VGAM1819 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60540] Nucleotide sequences of the VGAM1819 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1819 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1819 are further described hereinbelow with reference to Table 1.

[60541] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1819 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1819 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60542] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1819 gene, herein designated VGAM is inhibition of expression of VGAM1819 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1819 correlate with, and may be deduced from, the identity of the target genes which VGAM1819 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60543] Transmembrane Protease, Serine 3 (TMPRSS3, Accession NM\_024022) is a VGAM1819 host target gene. TMPRSS3 BINDING SITE1 through TMPRSS3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TMPRSS3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMPRSS3 BINDING SITE1 through TMPRSS3 BINDING SITE3, designated SEQ ID:23451, SEQ ID:26187 and SEQ ID:26189 respectively, to the nucleotide sequence of VGAM1819 RNA, herein designated VGAM RNA, also designated SEQ ID:4530.

[60544] A function of VGAM1819 is therefore inhibition of Transmembrane Protease, Serine 3 (TMPRSS3, Accession NM\_024022). Accordingly, utilities of VGAM1819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMPRSS3. KIAA0757 (Accession NM\_006038) is another VGAM1819 host target gene. KIAA0757 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by KIAA0757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0757 BINDING SITE, designated SEQ ID:12673, to the nucleotide sequence of VGAM1819 RNA, herein designated VGAM RNA, also designated SEQ ID:4530.

[60545] Another function of VGAM1819 is therefore inhibition of KIAA0757 (Accession NM\_006038). Accordingly, utilities of VGAM1819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0757. KIAA0828 (Accession XM\_088105) is another VGAM1819 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39512, to the nucleotide sequence of VGAM1819 RNA, herein designated VGAM RNA, also designated SEQ ID:4530.

[60546] Another function of VGAM1819 is therefore inhibition of

KIAA0828 (Accession XM\_088105). Accordingly, utilities of VGAM1819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. LOC51133 (Accession NM\_016121) is another VGAM1819 host target gene. LOC51133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51133 BINDING SITE, designated SEQ ID:18206, to the nucleotide sequence of VGAM1819 RNA, herein designated VGAM RNA, also designated SEQ ID:4530.

[60547] Another function of VGAM1819 is therefore inhibition of LOC51133 (Accession NM\_016121). Accordingly, utilities of VGAM1819 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51133. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1820 (VGAM1820) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[60548] VGAM1820 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1820 was detected is described hereinabove with reference to Figs. 1–8.

[60549] VGAM1820 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus. VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60550] VGAM1820 gene encodes a VGAM1820 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1820 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1820 precursor RNA is designated SEQ ID:1806, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1806 is located at position 7825 relative to the genome of Cryphonectria Hypovirus.

[60551] VGAM1820 precursor RNA folds onto itself, forming VGAM1820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60552] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1820 folded precursor RNA into VGAM1820 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1820 RNA is designated SEQ ID:4531, and is provided hereinbelow with reference to the sequence listing part.

[60553] VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1820 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[60554] VGAM1820 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1820 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1820 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[60555] The complementary binding of VGAM1820 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1820 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1820 host target RNA into VGAM1820 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60556] It is appreciated that VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1820 host target genes. The mRNA of each one of this plurality of VGAM1820 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1820 RNA, herein designated VGAM RNA, and which when bound by VGAM1820 RNA causes inhibition of translation of respective one or more VGAM1820 host target proteins.

[60557] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1820 gene, herein designated VGAM GENE, on one

or more VGAM1820 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60558] It is yet further appreciated that a function of VGAM1820 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus. Specific functions, and accordingly utilities, of VGAM1820 correlate with, and may be deduced from, the identity of the host target genes which VGAM1820 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60559] Nucleotide sequences of the VGAM1820 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1820 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1820 are further described hereinbelow with reference to Table 1.

[60560] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1820 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1820 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60561] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1820 gene, herein designated VGAM is inhibition of expression of VGAM1820 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1820 correlate with, and may be deduced from, the identity of the target genes which VGAM1820 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60562] Estrogen-related Receptor Beta Like 1 (ESRRBL1, Acces-

sion NM\_018010) is a VGAM1820 host target gene. ESR-RBL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESRRBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRBL1 BINDING SITE, designated SEQ ID:19743, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60563] A function of VGAM1820 is therefore inhibition of Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRBL1. Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM\_022549) is another VGAM1820 host target gene. FEZ1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FEZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:22878, to the nu-

cleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60564] Another function of VGAM1820 is therefore inhibition of Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM\_022549), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1. The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is another VGAM1820 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45220, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60565] Another function of VGAM1820 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Homeo Box D4 (HOXD4, Accession NM\_014621) is another VGAM1820 host target gene. HOXD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:15982, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60566] Another function of VGAM1820 is therefore inhibition of Homeo Box D4 (HOXD4, Accession NM\_014621), a gene

which is part of a developmental regulatory system. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD4. The function of HOXD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM330.

NKX3A (Accession NM\_006167) is another VGAM1820 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12827, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60567] Another function of VGAM1820 is therefore inhibition of NKX3A (Accession NM\_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A and its as-

sociation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063) is another VGAM1820 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11491, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60568] Another function of VGAM1820 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM\_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314. SMT3 Suppressor of Mif Two 3 Homolog 1

(yeast) (SMT3H1, Accession XM\_009805) is another VGAM1820 host target gene. SMT3H1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMT3H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H1 BINDING SITE, designated SEQ ID:30124, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60569] Another function of VGAM1820 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM\_009805), a gene which is involved in the function and/or structure of the eukaryotic kinetochore. Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H1. The function of SMT3H1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Chromobox Homolog 3 (HP1 gamma homolog, Drosophila) (CBX3, Accession NM\_007276) is another VGAM1820 host target gene. CBX3 BINDING SITE1 and

CBX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX3 BINDING SITE1 and CBX3 BINDING SITE2, designated SEQ ID:14141 and SEQ ID:18661 respectively, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60570] Another function of VGAM1820 is therefore inhibition of Chromobox Homolog 3 (HP1 gamma homolog, Drosophila) (CBX3, Accession NM\_007276). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX3. Chromosome Y Open Reading Frame 14 (CYorf14, Accession NM\_018542) is another VGAM1820 host target gene. CYorf14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYorf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYorf14 BINDING SITE, designated SEQ ID:20613, to the nucleotide sequence of

VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60571] Another function of VGAM1820 is therefore inhibition of Chromosome Y Open Reading Frame 14 (CYorf14, Accession NM\_018542). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYorf14. DKFZP434I092 (Accession XM\_042042) is another VGAM1820 host target gene. DKFZP434I092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434I092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I092 BINDING SITE, designated SEQ ID:33675, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60572] Another function of VGAM1820 is therefore inhibition of DKFZP434I092 (Accession XM\_042042). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I092. FLJ14827 (Accession NM\_032848) is another VGAM1820 host target gene. FLJ14827 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14827 BINDING SITE, designated SEQ ID:26642, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60573] Another function of VGAM1820 is therefore inhibition of FLJ14827 (Accession NM\_032848). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14827. KIAA0247 (Accession NM\_014734) is another VGAM1820 host target gene. KIAA0247 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0247 BINDING SITE, designated SEQ ID:16371, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60574] Another function of VGAM1820 is therefore inhibition of

KIAA0247 (Accession NM\_014734). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0247. KIAA0367 (Accession XM\_041018) is another VGAM1820 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33417, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60575] Another function of VGAM1820 is therefore inhibition of KIAA0367 (Accession XM\_041018). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA1040 (Accession XM\_051091) is another VGAM1820 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35741, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60576] Another function of VGAM1820 is therefore inhibition of KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. Phosphodiesterase 7B (PDE7B, Accession NM\_018945) is another VGAM1820 host target gene. PDE7B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDE7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE7B BINDING SITE, designated SEQ ID:21011, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60577] Another function of VGAM1820 is therefore inhibition of Phosphodiesterase 7B (PDE7B, Accession NM\_018945). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PDE7B. LOC145134 (Accession XM\_096722) is another VGAM1820 host target gene. LOC145134 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145134 BINDING SITE, designated SEQ ID:40502, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60578] Another function of VGAM1820 is therefore inhibition of LOC145134 (Accession XM\_096722). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145134. LOC90246 (Accession XM\_030283) is another VGAM1820 host target gene. LOC90246 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90246 BINDING SITE, designated SEQ ID:31000, to the

nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60579] Another function of VGAM1820 is therefore inhibition of LOC90246 (Accession XM\_030283). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90246. LOC93097 (Accession XM\_049221) is another VGAM1820 host target gene. LOC93097 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93097 BINDING SITE, designated SEQ ID:35355, to the nucleotide sequence of VGAM1820 RNA, herein designated VGAM RNA, also designated SEQ ID:4531.

[60580] Another function of VGAM1820 is therefore inhibition of LOC93097 (Accession XM\_049221). Accordingly, utilities of VGAM1820 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93097. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1821 (VGAM1821) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60581] VGAM1821 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1821 was detected is described hereinabove with reference to Figs. 1–8.

[60582] VGAM1821 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60583] VGAM1821 gene encodes a VGAM1821 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1821 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1821 precursor RNA is designated SEQ ID:1807, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1807 is located at position 28943 relative to the genome of Variola Virus.

[60584] VGAM1821 precursor RNA folds onto itself, forming VGAM1821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60585] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1821 folded precursor RNA into VGAM1821 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1821 RNA is designated SEQ ID:4532, and is provided hereinbelow with reference to the sequence listing part.

[60586] VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1821 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1821 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[60587] VGAM1821 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1821 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1821 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60588] The complementary binding of VGAM1821 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1821 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1821 host target RNA into VGAM1821 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60589] It is appreciated that VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1821 host target genes. The mRNA of each one of this plurality of VGAM1821 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1821 RNA, herein designated VGAM RNA, and which when bound by VGAM1821 RNA causes inhibition of translation of respective one or more VGAM1821 host target proteins.

[60590] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1821 gene, herein designated VGAM GENE, on one or more VGAM1821 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60591] It is yet further appreciated that a function of VGAM1821 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1821 correlate with, and may be deduced from, the identity of the host

target genes which VGAM1821 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60592] Nucleotide sequences of the VGAM1821 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1821 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1821 are further described hereinbelow with reference to Table 1.

[60593] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1821 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1821 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60594] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1821 gene, herein designated VGAM is inhibition of expression of VGAM1821 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1821 correlate with, and may be deduced from, the identity of the target genes which VGAM1821

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60595] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM\_004776) is a VGAM1821 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11170, to the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60596] A function of VGAM1821 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM\_004776). Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. BCL2-antagonist/killer 1 (BAK1, Accession XM\_166333) is another VGAM1821 host target gene. BAK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAK1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAK1 BINDING SITE, designated SEQ ID:44175, to the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60597] Another function of VGAM1821 is therefore inhibition of BCL2-antagonist/killer 1 (BAK1, Accession XM\_166333), a gene which accelerates programmed cell death by binding to, and antagonizing the a repressor bcl-2. Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAK1. The function of BAK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.Forkhead Box O1A

(rhabdomyosarcoma) (FOXO1A, Accession NM\_002015) is another VGAM1821 host target gene. FOXO1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXO1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:7758, to the

nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60598] Another function of VGAM1821 is therefore inhibition of Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM\_002015), a gene which is a probable transcription factor. Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO1A. The function of FOXO1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228. Angiomotin Like 2 (AMOTL2, Accession NM\_016201) is another VGAM1821 host target gene. AMOTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL2 BINDING SITE, designated SEQ ID:18293, to the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60599] Another function of VGAM1821 is therefore inhibition of

Angiomotin Like 2 (AMOTL2, Accession NM\_016201). Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL2. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016) is another VGAM1821 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BINDING SITE, designated SEQ ID:27624, to the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60600] Another function of VGAM1821 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016). Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. MGC10999 (Accession NM\_032307) is another VGAM1821 host target gene. MGC10999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10999, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10999 BINDING SITE, designated SEQ ID:26090, to the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60601] Another function of VGAM1821 is therefore inhibition of MGC10999 (Accession NM\_032307). Accordingly, utilities of VGAM1821 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10999. LOC153259 (Accession XM\_098342) is another VGAM1821 host target gene. LOC153259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153259 BINDING SITE, designated SEQ ID:41600, to the nucleotide sequence of VGAM1821 RNA, herein designated VGAM RNA, also designated SEQ ID:4532.

[60602] Another function of VGAM1821 is therefore inhibition of LOC153259 (Accession XM\_098342). Accordingly, utilities of VGAM1821 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC153259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1822 (VGAM1822) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60603] VGAM1822 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1822 was detected is described hereinabove with reference to Figs. 1–8.

[60604] VGAM1822 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus. VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60605] VGAM1822 gene encodes a VGAM1822 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1822 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1822 precursor RNA is desig-

nated SEQ ID:1808, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1808 is located at position 9148 relative to the genome of Cryphonectria Hypovirus.

[60606] VGAM1822 precursor RNA folds onto itself, forming VGAM1822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60607] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1822 folded precursor RNA into VGAM1822 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1822 RNA is designated SEQ ID:4533, and is provided hereinbelow with reference to the sequence

listing part.

[60608] VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1822 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60609] VGAM1822 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1822 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1822 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60610] The complementary binding of VGAM1822 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1822 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1822 host target RNA into VGAM1822 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60611] It is appreciated that VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1822 host target genes. The mRNA of each one of this plurality of VGAM1822 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1822 RNA, herein designated VGAM

RNA, and which when bound by VGAM1822 RNA causes inhibition of translation of respective one or more VGAM1822 host target proteins.

[60612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1822 gene, herein designated VGAM GENE, on one or more VGAM1822 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60613] It is yet further appreciated that a function of VGAM1822 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1822 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus. Specific functions, and accordingly utilities, of VGAM1822 correlate with, and may be deduced from, the identity of the host target genes which VGAM1822 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60614] Nucleotide sequences of the VGAM1822 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1822 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1822 are further described hereinbelow with reference to Table 1.

[60615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1822 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1822 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60616] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1822 gene, herein designated VGAM is

inhibition of expression of VGAM1822 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1822 correlate with, and may be deduced from, the identity of the target genes which VGAM1822 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60617] MEP50 (Accession NM\_024102) is a VGAM1822 host target gene. MEP50 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEP50, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEP50 BINDING SITE, designated SEQ ID:23548, to the nucleotide sequence of VGAM1822 RNA, herein designated VGAM RNA, also designated SEQ ID:4533.

[60618] A function of VGAM1822 is therefore inhibition of MEP50 (Accession NM\_024102). Accordingly, utilities of VGAM1822 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEP50. LOC139197 (Accession XM\_066541) is another VGAM1822 host target gene. LOC139197 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC139197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139197 BINDING SITE, designated SEQ ID:37329, to the nucleotide sequence of VGAM1822 RNA, herein designated VGAM RNA, also designated SEQ ID:4533.

[60619] Another function of VGAM1822 is therefore inhibition of LOC139197 (Accession XM\_066541). Accordingly, utilities of VGAM1822 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139197. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1823 (VGAM1823) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60620] VGAM1823 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1823 was detected is described hereinabove with reference to Figs. 1-8.

[60621] VGAM1823 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cryphonectria Hypovirus. VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60622] VGAM1823 gene encodes a VGAM1823 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1823 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1823 precursor RNA is designated SEQ ID:1809, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1809 is located at position 3317 relative to the genome of Cryphonectria Hypovirus.

[60623] VGAM1823 precursor RNA folds onto itself, forming VGAM1823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60624] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1823 folded precursor RNA into VGAM1823 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1823 RNA is designated SEQ ID:4534, and is provided hereinbelow with reference to the sequence listing part.

[60625] VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1823 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60626] VGAM1823 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1823 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1823 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60627] The complementary binding of VGAM1823 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1823 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1823

host target RNA into VGAM1823 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60628] It is appreciated that VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1823 host target genes. The mRNA of each one of this plurality of VGAM1823 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1823 RNA, herein designated VGAM RNA, and which when bound by VGAM1823 RNA causes inhibition of translation of respective one or more VGAM1823 host target proteins.

[60629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1823 gene, herein designated VGAM GENE, on one or more VGAM1823 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60630] It is yet further appreciated that a function of VGAM1823 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus. Specific functions, and accordingly utilities, of VGAM1823 correlate with, and may be deduced from, the identity of the host target genes which VGAM1823 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60631] Nucleotide sequences of the VGAM1823 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1823 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1823 are further

described hereinbelow with reference to Table 1.

[60632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1823 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1823 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60633] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1823 gene, herein designated VGAM is inhibition of expression of VGAM1823 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1823 correlate with, and may be deduced from, the identity of the target genes which VGAM1823 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60634] KIAA0547 (Accession NM\_014793) is a VGAM1823 host target gene. KIAA0547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0547 BINDING SITE,

designated SEQ ID:16693, to the nucleotide sequence of VGAM1823 RNA, herein designated VGAM RNA, also designated SEQ ID:4534.

[60635] A function of VGAM1823 is therefore inhibition of KIAA0547 (Accession NM\_014793). Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0547. NDP52 (Accession NM\_005831) is another VGAM1823 host target gene. NDP52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDP52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP52 BINDING SITE, designated SEQ ID:12446, to the nucleotide sequence of VGAM1823 RNA, herein designated VGAM RNA, also designated SEQ ID:4534.

[60636] Another function of VGAM1823 is therefore inhibition of NDP52 (Accession NM\_005831). Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP52. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM\_014835) is another VGAM1823 host target gene. OS-

BPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, designated SEQ ID:16847 and SEQ ID:29315 respectively, to the nucleotide sequence of VGAM1823 RNA, herein designated VGAM RNA, also designated SEQ ID:4534.

[60637] Another function of VGAM1823 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM\_014835). Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. LOC197358 (Accession XM\_113872) is another VGAM1823 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42509, to the nucleotide sequence of

VGAM1823 RNA, herein designated VGAM RNA, also designated SEQ ID:4534.

[60638] Another function of VGAM1823 is therefore inhibition of LOC197358 (Accession XM\_113872). Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. LOC200317 (Accession XM\_114208) is another VGAM1823 host target gene. LOC200317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200317 BINDING SITE, designated SEQ ID:42803, to the nucleotide sequence of VGAM1823 RNA, herein designated VGAM RNA, also designated SEQ ID:4534.

[60639] Another function of VGAM1823 is therefore inhibition of LOC200317 (Accession XM\_114208). Accordingly, utilities of VGAM1823 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1824 (VGAM1824) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60640] VGAM1824 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1824 was detected is described hereinabove with reference to Figs. 1–8.

[60641] VGAM1824 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus. VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60642] VGAM1824 gene encodes a VGAM1824 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1824 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1824 precursor RNA is designated SEQ ID:1810, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1810 is located at position 3901 relative to the genome of Cryphonectria Hypovirus.

[60643] VGAM1824 precursor RNA folds onto itself, forming VGAM1824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60644] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1824 folded precursor RNA into VGAM1824 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1824 RNA is designated SEQ ID:4535, and is provided hereinbelow with reference to the sequence listing part.

[60645] VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1824 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1824 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[60646] VGAM1824 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1824 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1824 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60647] The complementary binding of VGAM1824 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1824 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1824 host target RNA into VGAM1824 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60648] It is appreciated that VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1824 host target genes. The mRNA of each one of this plurality of VGAM1824 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1824 RNA, herein designated VGAM RNA, and which when bound by VGAM1824 RNA causes inhibition of translation of respective one or more VGAM1824 host target proteins.

[60649] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1824 gene, herein designated VGAM GENE, on one or more VGAM1824 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60650] It is yet further appreciated that a function of VGAM1824 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1824 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus. Specific functions, and accordingly utilities, of VGAM1824 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1824 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60651] Nucleotide sequences of the VGAM1824 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1824 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1824 are further described hereinbelow with reference to Table 1.

[60652] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1824 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1824 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60653] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1824 gene, herein designated VGAM is inhibition of expression of VGAM1824 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1824 correlate with, and may be deduced from, the identity of the target genes which VGAM1824

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60654] FLJ21032 (Accession NM\_024906) is a VGAM1824 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24395, to the nucleotide sequence of VGAM1824 RNA, herein designated VGAM RNA, also designated SEQ ID:4535.

[60655] A function of VGAM1824 is therefore inhibition of FLJ21032 (Accession NM\_024906). Accordingly, utilities of VGAM1824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. KIAA0258 (Accession NM\_014785) is another VGAM1824 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0258 BINDING SITE, designated SEQ ID:16642, to the nucleotide sequence of VGAM1824 RNA, herein designated VGAM RNA, also designated SEQ ID:4535.

[60656] Another function of VGAM1824 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM1824 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1825 (VGAM1825) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60657] VGAM1825 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1825 was detected is described hereinabove with reference to Figs. 1–8.

[60658] VGAM1825 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60659] VGAM1825 gene encodes a VGAM1825 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1825 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1825 precursor RNA is designated SEQ ID:1811, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1811 is located at position 34526 relative to the genome of Vaccinia Virus.

[60660] VGAM1825 precursor RNA folds onto itself, forming VGAM1825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60661] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1825 folded precursor RNA into VGAM1825 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1825 RNA is designated SEQ ID:4536, and is provided hereinbelow with reference to the sequence listing part.

[60662] VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1825 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60663] VGAM1825 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1825 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1825 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60664] The complementary binding of VGAM1825 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1825 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1825 host target RNA into VGAM1825 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60665] It is appreciated that VGAM1825 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1825 host target genes. The mRNA of each one of this plurality of VGAM1825 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1825 RNA, herein designated VGAM RNA, and which when bound by VGAM1825 RNA causes inhibition of translation of respective one or more VGAM1825 host target proteins.

[60666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1825 gene, herein designated VGAM GENE, on one or more VGAM1825 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[60667] It is yet further appreciated that a function of VGAM1825 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM1825 correlate with, and may be deduced from, the identity of the host target genes which VGAM1825 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60668] Nucleotide sequences of the VGAM1825 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1825 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1825 are further described hereinbelow with reference to Table 1.

[60669] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1825 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1825 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60670] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1825 gene, herein designated VGAM is inhibition of expression of VGAM1825 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1825 correlate with, and may be deduced from, the identity of the target genes which VGAM1825 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60671] RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650) is a VGAM1825 host target gene. RASA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASA1 BINDING SITE, designated SEQ ID:22907, to the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, also designated SEQ ID:4536.

[60672] A function of VGAM1825 is therefore inhibition of RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650), a gene which is involved in the control of cellular proliferation and differentiation. Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASA1. The function of RASA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464.Selenoprotein P, Plasma, 1 (SEPP1, Accession NM\_005410) is another VGAM1825 host target gene. SEPP1 BINDING SITE1 and SEPP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEPP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPP1 BINDING SITE1 and SEPP1 BINDING SITE2, designated SEQ ID:11878 and SEQ ID:30185 respectively, to the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, also designated SEQ ID:4536.

[60673] Another function of VGAM1825 is therefore inhibition of

Selenoprotein P, Plasma, 1 (SEPP1, Accession NM\_005410), a gene which might be responsible for some of the extracellular antioxidant defense properties of selenium or might be involved in the transport of selenium. Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPP1. The function of SEPP1 has been established by previous studies. Selenium is an essential trace element that is incorporated as selenocysteine into the primary structure of selenoproteins. There are at least 10 animal selenoproteins. Nutritional deficiency of selenium decreases selenoprotein concentrations and leads to pathologic conditions. Human populations that are selenium deficient are susceptible to the development of Keshan disease, a cardiomyopathy of children reported in selenium-deficient areas of China (Keshan Disease Research Group of the Chinese Academy of Medical Sciences, 1979). Hill et al. (1996) cited animal studies that have demonstrated roles for selenium in oxidant defense, thyroid hormone metabolism, and defense against viral infections. Selenoproteins presumably mediate these biologic effects. Human selenoproteins include glutathione peroxidase-1 (OMIM Ref. No. 138320), thiore-

doxin reductase (OMIM Ref. No. 601112), glutathione peroxidase-2 (OMIM Ref. No. 138319), glutathione peroxidase-3 (OMIM Ref. No. 138321), thyroxine deiodinase type 1 (OMIM Ref. No. 147892), and mitochondrial capsule selenoprotein (OMIM Ref. No. 601148). Most of the known selenoproteins are members of the glutathione peroxidase or iodothyronine deiodinase families. Hill et al. (1996) stated that selenoprotein P (SEPP1) is a major selenoprotein that is not a member of those families. It is an extracellular glycoprotein that is present in several isoforms and is the only selenoprotein known to contain multiple selenocysteine residues (Hill et al., 1993). It is a heparin-binding protein that appears to be associated with endothelial cells and has been implicated as an oxidant defense in the extracellular space. Hill et al. (1993) cloned human selenoprotein P from a liver cDNA library. The human open reading frame is 69% identical to that of rat selenoprotein P and the predicted proteins share 72% amino acid identity. Hill et al. (1996) mapped the SEPP1 gene to chromosome 5 by Southern analysis of 2 somatic cell hybrid DNA panels using as a probe their liver cDNA library clone. They narrowed the assignment to 5q31 by fluorescence in situ hybridization. Only 1 SEPP1 locus was

detected. Although there is evidence of several isoforms of the protein, all of them share the same N-terminal sequence and therefore are likely products of the same gene (Chittum et al., 1996). Hill et al. (1996) commented that limb-girdle muscular dystrophy type 1A(LGMD1A; 159000) maps to the distal portion of 5q. They noted that since selenium deficiency is associated with nutritional muscular dystrophies in several species, it might be of interest to evaluate SEPP1 in that form of muscular dystrophy. Acute nonlymphocytic leukemia and the myelodysplastic syndrome are associated with deletions of a critical region of 5q.

[60674] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60675] Hill, K. E.; Dasouki, M.; Phillips, J. A., III; Burk, R. F. : Human selenoprotein P gene maps to 5q31. *Genomics* 36: 550–551, 1996. ; and

[60676] Hill, K. E.; Lloyd, R. S.; Burk, R. F. : Conserved nucleotide sequences in the open reading frame and 3-prime untranslated region of selenoprotein P mRNA. *Proc. Nat. Acad. Sci.* 90: 537–5.

[60677] Further studies establishing the function and utilities of

SEPP1 are found in John Hopkins OMIM database record ID 601484, and in cited publications numbered 7028–6830 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fatty Acid Desaturase 1 (FADS1, Accession NM\_013402) is another VGAM1825 host target gene. FADS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FADS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FADS1 BINDING SITE, designated SEQ ID:15067, to the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, also designated SEQ ID:4536.

[60678] Another function of VGAM1825 is therefore inhibition of Fatty Acid Desaturase 1 (FADS1, Accession NM\_013402). Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FADS1. GENX-3414 (Accession NM\_003943) is another VGAM1825 host target gene. GENX-3414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GENX-3414, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GENX-3414 BINDING SITE, designated SEQ ID:10059, to the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, also designated SEQ ID:4536.

[60679] Another function of VGAM1825 is therefore inhibition of GENX-3414 (Accession NM\_003943). Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GENX-3414. MGC3048 (Accession NM\_024052) is another VGAM1825 host target gene. MGC3048 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3048 BINDING SITE, designated SEQ ID:23488, to the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, also designated SEQ ID:4536.

[60680] Another function of VGAM1825 is therefore inhibition of MGC3048 (Accession NM\_024052). Accordingly, utilities of VGAM1825 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC3048. YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM\_139312) is another VGAM1825 host target gene. YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by YME1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2, designated SEQ ID:29293 and SEQ ID:15537 respectively, to the nucleotide sequence of VGAM1825 RNA, herein designated VGAM RNA, also designated SEQ ID:4536.

[60681] Another function of VGAM1825 is therefore inhibition of YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM\_139312). Accordingly, utilities of VGAM1825 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YME1L1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1826 (VGAM1826) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[60682] VGAM1826 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1826 was detected is described hereinabove with reference to Figs. 1–8.

[60683] VGAM1826 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60684] VGAM1826 gene encodes a VGAM1826 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1826 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1826 precursor RNA is designated SEQ ID:1812, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1812 is located at position 29285 relative to the genome of Variola Virus.

[60685] VGAM1826 precursor RNA folds onto itself, forming VGAM1826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60686] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1826 folded precursor RNA into VGAM1826 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1826 RNA is designated SEQ ID:4537, and is provided hereinbelow with reference to the sequence listing part.

[60687] VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1826 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[60688] VGAM1826 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1826 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1826 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[60689] The complementary binding of VGAM1826 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1826 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1826 host target RNA into VGAM1826 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60690] It is appreciated that VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1826 host target genes. The mRNA of each one of this plurality of VGAM1826 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1826 RNA, herein designated VGAM RNA, and which when bound by VGAM1826 RNA causes inhibition of translation of respective one or more VGAM1826 host target proteins.

[60691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1826 gene, herein designated VGAM GENE, on one

or more VGAM1826 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60692] It is yet further appreciated that a function of VGAM1826 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1826 correlate with, and may be deduced from, the identity of the host target genes which VGAM1826 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60693] Nucleotide sequences of the VGAM1826 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1826 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1826 are further described hereinbelow with reference to Table 1.

[60694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1826 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1826 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60695] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1826 gene, herein designated VGAM is inhibition of expression of VGAM1826 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1826 correlate with, and may be deduced from, the identity of the target genes which VGAM1826 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60696] Cyclin D2 (CCND2, Accession NM\_001759) is a VGAM1826

host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7512, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60697] A function of VGAM1826 is therefore inhibition of Cyclin D2 (CCND2, Accession NM\_001759), a gene which is essential for the control of the cell cycle at the g1/s (start) transition. Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Hyaluronan Synthase 2 (HAS2, Accession NM\_005328) is another VGAM1826 host target gene. HAS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAS2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS2 BINDING SITE, designated SEQ ID:11801, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60698] Another function of VGAM1826 is therefore inhibition of Hyaluronan Synthase 2 (HAS2, Accession NM\_005328), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis and transport . Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS2. The function of HAS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM874. Integrin, Beta-like 1 (with EGF-like repeat domains) (ITGBL1, Accession NM\_004791) is another VGAM1826 host target gene. ITGBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGBL1 BINDING SITE, designated SEQ ID:11201, to the nucleotide se-

quence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60699] Another function of VGAM1826 is therefore inhibition of Integrin, Beta-like 1 (with EGF-like repeat domains) (ITGBL1, Accession NM\_004791). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGBL1. Neurofilament, Heavy Polypeptide 200kDa (NEFH, Accession NM\_021076) is another VGAM1826 host target gene. NEFH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEFH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEFH BINDING SITE, designated SEQ ID:22046, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60700] Another function of VGAM1826 is therefore inhibition of Neurofilament, Heavy Polypeptide 200kDa (NEFH, Accession NM\_021076), a gene which is involved in the maintenance of neuronal caliber and in mature axons. Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NEFH. The function of NEFH has been established by previous studies. See 162280. Mattei et al. (1988) used a rat cDNA probe coding for the C-terminal extension of the NFH gene to assign, by in situ hybridization, the human NFH gene to 22q12.1-q13.1. The possible implications of the fact that neurologic disorders such as meningioma map to this region were discussed. In the course of cloning the region between 2 markers, D22S212 and D22S32, that flank the NF2 (OMIM Ref. No. 101000) gene, Rouleau et al. (1993) identified a gene with a neuronal pattern of expression and a transcript size identical to that of NEFH. Use of NEFH cDNA confirmed the identity. There is compelling evidence that the NEFH locus is close to the NF2 locus. For example, Watson et al. (1993) found that the NEFH locus was hemizygous in a deletion that was observed in affected members of a family with NF2 and was estimated to be about 700 kb long. The NF2 locus has been positioned at 22q12.2. Bucan et al. (1993) mapped the homologous murine gene, which they symbolized *Nfh*, to chromosome 11. The tail of the heavy neurofilament subunit is composed of the repeating amino acid motif, usually X-ly-sine-serine-proline-Y-lysine (OMIM Ref. No. XKSPYK),

where X is a single amino acid and Y is 1 to 3 amino acids. There are 2 common polymorphic variants of 44 and 45 repeats. The tail probably regulates axonal caliber, with interfilament spacing determined by phosphorylation of the KSP motifs. According to Al-Chalabi et al. (1999), the polymorphic variants had been mislabeled in the published literature as 44 and 43 repeat variants, respectively, and therefore were referred to by them simply as long (L) and short (S) alleles.

[60701] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60702] Al-Chalabi, A.; Andersen, P. M.; Nilsson, P.; Chioza, B.; Andersson, J. L.; Russ, C.; Shaw, C. E.; Powell, J. F.; Leigh, P. N. : Deletions of the heavy neurofilament subunit tail in amyotrophic lateral sclerosis. Hum. Molec. Genet. 8: 157–164, 1999. ; and

[60703] Watson, C. J.; Gaunt, L.; Evans, G.; Patel, K.; Harris, R.; Strachan, T. : A disease-associated germline deletion maps the type 2 neurofibromatosis (NF2) gene between the Ewing sarcoma.

[60704] Further studies establishing the function and utilities of NEFH are found in John Hopkins OMIM database record ID

162230, and in cited publications numbered 1029 and 10293–10301 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM\_012264) is another VGAM1826 host target gene. C22orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf5 BINDING SITE, designated SEQ ID:14585, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60705] Another function of VGAM1826 is therefore inhibition of Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM\_012264). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf5. Centaurin, Beta 5 (CENTB5, Accession XM\_170937) is another VGAM1826 host target gene. CENTB5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENTB5, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTB5 BINDING SITE, designated SEQ ID:45723, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60706] Another function of VGAM1826 is therefore inhibition of Centaurin, Beta 5 (CENTB5, Accession XM\_170937). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTB5. FLJ00026 (Accession XM\_036307) is another VGAM1826 host target gene. FLJ00026 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ00026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00026 BINDING SITE, designated SEQ ID:32427, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60707] Another function of VGAM1826 is therefore inhibition of FLJ00026 (Accession XM\_036307). Accordingly, utilities of

VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00026. FLJ10718 (Accession NM\_018192) is another VGAM1826 host target gene. FLJ10718 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10718 BINDING SITE, designated SEQ ID:20048, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60708] Another function of VGAM1826 is therefore inhibition of FLJ10718 (Accession NM\_018192). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10718. FLJ10743 (Accession NM\_018201) is another VGAM1826 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743

BINDING SITE, designated SEQ ID:20081, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60709] Another function of VGAM1826 is therefore inhibition of FLJ10743 (Accession NM\_018201). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. FLJ14260 (Accession NM\_025027) is another VGAM1826 host target gene. FLJ14260 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14260 BINDING SITE, designated SEQ ID:24618, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60710] Another function of VGAM1826 is therefore inhibition of FLJ14260 (Accession NM\_025027). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14260. FLJ14800 (Accession NM\_032840) is another VGAM1826 host target gene. FLJ14800 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14800 BINDING SITE, designated SEQ ID:26620, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60711] Another function of VGAM1826 is therefore inhibition of FLJ14800 (Accession NM\_032840). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14800. FLJ14810 (Accession NM\_032843) is another VGAM1826 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26631, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60712] Another function of VGAM1826 is therefore inhibition of

FLJ14810 (Accession NM\_032843). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14810. FLJ20079 (Accession NM\_017656) is another VGAM1826 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19172, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60713] Another function of VGAM1826 is therefore inhibition of FLJ20079 (Accession NM\_017656). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ30294 (Accession NM\_144632) is another VGAM1826 host target gene. FLJ30294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ30294 BINDING SITE, designated SEQ ID:29449, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60714] Another function of VGAM1826 is therefore inhibition of FLJ30294 (Accession NM\_144632). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30294. KIAA0430 (Accession NM\_019081) is another VGAM1826 host target gene. KIAA0430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0430 BINDING SITE, designated SEQ ID:21152, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60715] Another function of VGAM1826 is therefore inhibition of KIAA0430 (Accession NM\_019081). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0430. KIAA0564 (Accession XM\_038664) is another

VGAM1826 host target gene. KIAA0564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:32900, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60716] Another function of VGAM1826 is therefore inhibition of KIAA0564 (Accession XM\_038664). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564. MGC15882 (Accession NM\_032884) is another VGAM1826 host target gene. MGC15882 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15882 BINDING SITE, designated SEQ ID:26706, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60717] Another function of VGAM1826 is therefore inhibition of MGC15882 (Accession NM\_032884). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15882. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM\_004263) is another VGAM1826 host target gene. SEMA4F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE, designated SEQ ID:10460, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60718] Another function of VGAM1826 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM\_004263). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. Sialyltransferase 4A

(beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM\_003033) is another VGAM1826 host target gene. SIAT4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIAT4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT4A BINDING SITE, designated SEQ ID:8978, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60719] Another function of VGAM1826 is therefore inhibition of Sialyltransferase 4A (beta-galactoside alpha-2,3-sialyltransferase) (SIAT4A, Accession NM\_003033). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT4A. VEZATIN (Accession NM\_017599) is another VGAM1826 host target gene. VEZATIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VEZATIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of VEZATIN BINDING SITE, designated SEQ ID:19068, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60720] Another function of VGAM1826 is therefore inhibition of VEZATIN (Accession NM\_017599). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN. LOC120087 (Accession XM\_061853) is another VGAM1826 host target gene. LOC120087 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120087 BINDING SITE, designated SEQ ID:37208, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60721] Another function of VGAM1826 is therefore inhibition of LOC120087 (Accession XM\_061853). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120087. LOC138128 (Accession XM\_070769) is an-

other VGAM1826 host target gene. LOC138128 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138128 BINDING SITE, designated SEQ ID:37393, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60722] Another function of VGAM1826 is therefore inhibition of LOC138128 (Accession XM\_070769). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138128. LOC148930 (Accession XM\_086369) is another VGAM1826 host target gene. LOC148930 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148930 BINDING SITE, designated SEQ ID:38616, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60723] Another function of VGAM1826 is therefore inhibition of LOC148930 (Accession XM\_086369). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148930. LOC150372 (Accession XM\_086893) is another VGAM1826 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38936, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60724] Another function of VGAM1826 is therefore inhibition of LOC150372 (Accession XM\_086893). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. LOC151877 (Accession XM\_098132) is another VGAM1826 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41393, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60725] Another function of VGAM1826 is therefore inhibition of LOC151877 (Accession XM\_098132). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC154761 (Accession XM\_088038) is another VGAM1826 host target gene. LOC154761 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154761 BINDING SITE, designated SEQ ID:39483, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60726] Another function of VGAM1826 is therefore inhibition of LOC154761 (Accession XM\_088038). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC154761. LOC163882 (Accession XM\_089211) is another VGAM1826 host target gene. LOC163882 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163882 BINDING SITE, designated SEQ ID:39973, to the nucleotide sequence of VGAM1826 RNA, herein designated VGAM RNA, also designated SEQ ID:4537.

[60727] Another function of VGAM1826 is therefore inhibition of LOC163882 (Accession XM\_089211). Accordingly, utilities of VGAM1826 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163882. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1827 (VGAM1827) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60728] VGAM1827 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1827 was detected is described hereinabove with reference to Figs. 1–8.

[60729] VGAM1827 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60730] VGAM1827 gene encodes a VGAM1827 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1827 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1827 precursor RNA is designated SEQ ID:1813, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1813 is located at position 144104 relative to the genome of Rabbit Fibroma Virus.

[60731] VGAM1827 precursor RNA folds onto itself, forming VGAM1827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60732] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1827 folded precursor RNA into VGAM1827 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1827 RNA is designated SEQ ID:4538, and is provided hereinbelow with reference to the sequence listing part.

[60733] VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1827 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60734] VGAM1827 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1827 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1827 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60735] The complementary binding of VGAM1827 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1827 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1827 host target RNA into VGAM1827 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60736] It is appreciated that VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1827 host target genes. The mRNA of each one of this plurality of VGAM1827 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1827 RNA, herein designated VGAM RNA, and which when bound by VGAM1827 RNA causes inhibition of translation of respective one or more VGAM1827 host target proteins.

[60737] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1827 gene, herein designated VGAM GENE, on one or more VGAM1827 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60738] It is yet further appreciated that a function of VGAM1827 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1827 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1827 correlate with, and may be deduced from, the identity of the host target genes which VGAM1827 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60739] Nucleotide sequences of the VGAM1827 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1827 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1827 are further described hereinbelow with reference to Table 1.

[60740] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1827 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1827 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60741] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1827 gene, herein designated VGAM is inhibition of expression of VGAM1827 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1827 correlate with, and may be deduced from, the identity of the target genes which VGAM1827 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60742] SE57-1 (Accession NM\_025214) is a VGAM1827 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24886, to the nucleotide sequence of VGAM1827 RNA, herein designated VGAM RNA, also designated SEQ ID:4538.

[60743] A function of VGAM1827 is therefore inhibition of SE57-1 (Accession NM\_025214). Accordingly, utilities of VGAM1827 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1828 (VGAM1828) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60744] VGAM1828 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1828 was detected is described hereinabove with reference to Figs. 1-8.

[60745] VGAM1828 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus.

VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60746] VGAM1828 gene encodes a VGAM1828 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1828 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1828 precursor RNA is designated SEQ ID:1814, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1814 is located at position 140535 relative to the genome of Rabbit Fibroma Virus.

[60747] VGAM1828 precursor RNA folds onto itself, forming VGAM1828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60748] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1828 folded precursor RNA into VGAM1828 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1828 RNA is designated SEQ ID:4539, and is provided hereinbelow with reference to the sequence listing part.

[60749] VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1828 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60750] VGAM1828 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1828 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1828 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60751] The complementary binding of VGAM1828 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1828 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1828 host target RNA into VGAM1828 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60752] It is appreciated that VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1828 host target genes. The mRNA of each one of this plurality of VGAM1828 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1828 RNA, herein designated VGAM RNA, and which when bound by VGAM1828 RNA causes inhibition of translation of respective one or more VGAM1828 host target proteins.

[60753] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1828 gene, herein designated VGAM GENE, on one or more VGAM1828 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60754] It is yet further appreciated that a function of VGAM1828 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1828 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1828 correlate with, and may be deduced from, the identity of the host target genes which VGAM1828 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60755] Nucleotide sequences of the VGAM1828 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1828 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1828 are further described hereinbelow with reference to Table 1.

[60756] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1828 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1828 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60757] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1828 gene, herein designated VGAM is inhibition of expression of VGAM1828 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1828 correlate with, and may be deduced from, the identity of the target genes which VGAM1828 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60758] Transducin (beta)-like 1X-linked (TBL1X, Accession NM\_005647) is a VGAM1828 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12184, to the

nucleotide sequence of VGAM1828 RNA, herein designated VGAM RNA, also designated SEQ ID:4539.

[60759] A function of VGAM1828 is therefore inhibition of Transducin (beta)-like 1X-linked (TBL1X, Accession NM\_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM1828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM\_004709) is another VGAM1828 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11056, to the nucleotide sequence of VGAM1828 RNA, herein designated VGAM RNA, also designated SEQ ID:4539.

[60760] Another function of VGAM1828 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession

NM\_004709). Accordingly, utilities of VGAM1828 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1829 (VGAM1829) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60761] VGAM1829 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1829 was detected is described hereinabove with reference to Figs. 1-8.

[60762] VGAM1829 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60763] VGAM1829 gene encodes a VGAM1829 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1829 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1829 precursor RNA is designated SEQ ID:1815, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1815 is located at position 140030 relative to the genome of Rabbit Fibroma Virus.

[60764] VGAM1829 precursor RNA folds onto itself, forming VGAM1829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60765] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1829 folded precursor RNA into VGAM1829 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1829 RNA is designated SEQ ID:4540, and

is provided hereinbelow with reference to the sequence listing part.

[60766] VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1829 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[60767] VGAM1829 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1829 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1829 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60768] The complementary binding of VGAM1829 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1829 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1829 host target RNA into VGAM1829 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60769] It is appreciated that VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1829 host target genes. The mRNA of each one of this plurality of VGAM1829 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1829 RNA, herein designated VGAM RNA, and which when bound by VGAM1829 RNA causes inhibition of translation of respective one or more VGAM1829 host target proteins.

[60770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1829 gene, herein designated VGAM GENE, on one or more VGAM1829 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60771] It is yet further appreciated that a function of VGAM1829 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1829 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM1829 correlate with, and may be deduced from, the identity of the host target genes which VGAM1829 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60772] Nucleotide sequences of the VGAM1829 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1829 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1829 are further described hereinbelow with reference to Table 1.

[60773] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1829 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1829 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60774] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1829 gene, herein designated VGAM is inhibition of expression of VGAM1829 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1829 correlate with, and may be deduced from, the identity of the target genes which VGAM1829 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60775] DKFZP564L0864 (Accession XM\_051905) is a VGAM1829 host target gene. DKFZP564L0864 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564L0864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564L0864 BINDING SITE, designated SEQ ID:35918, to the nucleotide sequence of VGAM1829 RNA, herein designated VGAM RNA, also designated SEQ ID:4540.

[60776] A function of VGAM1829 is therefore inhibition of DKFZP564L0864 (Accession XM\_051905). Accordingly, utilities of VGAM1829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564L0864. KIAA1596 (Accession XM\_048128) is another VGAM1829 host target gene. KIAA1596 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1596 BINDING SITE, designated SEQ ID:35119, to the nucleotide sequence of VGAM1829 RNA, herein designated VGAM RNA, also designated SEQ ID:4540.

[60777] Another function of VGAM1829 is therefore inhibition of KIAA1596 (Accession XM\_048128). Accordingly, utilities of VGAM1829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1596. LOC90246 (Accession XM\_030283) is another VGAM1829 host target gene. LOC90246 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90246 BINDING SITE, designated SEQ ID:31002, to the nucleotide sequence of VGAM1829 RNA, herein designated VGAM RNA, also designated SEQ ID:4540.

[60778] Another function of VGAM1829 is therefore inhibition of

LOC90246 (Accession XM\_030283). Accordingly, utilities of VGAM1829 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90246. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1830 (VGAM1830) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60779] VGAM1830 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1830 was detected is described hereinabove with reference to Figs. 1-8.

[60780] VGAM1830 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60781] VGAM1830 gene encodes a VGAM1830 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1830 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1830 precursor RNA is designated SEQ ID:1816, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1816 is located at position 40729 relative to the genome of Camelpox Virus.

[60782] VGAM1830 precursor RNA folds onto itself, forming VGAM1830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60783] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1830 folded precursor RNA into VGAM1830 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1830 RNA is designated SEQ ID:4541, and is provided hereinbelow with reference to the sequence listing part.

[60784] VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1830 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60785] VGAM1830 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1830 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1830 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60786] The complementary binding of VGAM1830 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1830 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1830 host target RNA into VGAM1830 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60787] It is appreciated that VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1830 host target genes. The mRNA of each one of this plurality of VGAM1830 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1830 RNA, herein designated VGAM RNA, and which when bound by VGAM1830 RNA causes inhibition of translation of respective one or more VGAM1830 host target proteins.

[60788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1830 gene, herein designated VGAM GENE, on one or more VGAM1830 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60789] It is yet further appreciated that a function of VGAM1830

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1830 correlate with, and may be deduced from, the identity of the host target genes which VGAM1830 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60790] Nucleotide sequences of the VGAM1830 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1830 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1830 are further described hereinbelow with reference to Table 1.

[60791] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1830 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1830 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60792] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1830 gene, herein designated VGAM is inhibition of expression of VGAM1830 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1830 correlate with, and may be deduced from, the identity of the target genes which VGAM1830 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60793] FLJ12270 (Accession NM\_030581) is a VGAM1830 host target gene. FLJ12270 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12270 BINDING SITE, designated SEQ ID:24953, to the nucleotide sequence of VGAM1830 RNA, herein designated VGAM RNA, also designated SEQ ID:4541.

[60794] A function of VGAM1830 is therefore inhibition of FLJ12270 (Accession NM\_030581). Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12270. OSRF (Accession XM\_003724) is another

VGAM1830 host target gene. OSRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSRF BINDING SITE, designated SEQ ID:29941, to the nucleotide sequence of VGAM1830 RNA, herein designated VGAM RNA, also designated SEQ ID:4541.

[60795] Another function of VGAM1830 is therefore inhibition of OSRF (Accession XM\_003724). Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSRF. POPX1 (Accession NM\_014906) is another VGAM1830 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17116, to the nucleotide sequence of VGAM1830 RNA, herein designated VGAM RNA, also designated SEQ ID:4541.

[60796] Another function of VGAM1830 is therefore inhibition of POPX1 (Accession NM\_014906). Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. LOC124045 (Accession XM\_071873) is another VGAM1830 host target gene. LOC124045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124045 BINDING SITE, designated SEQ ID:37439, to the nucleotide sequence of VGAM1830 RNA, herein designated VGAM RNA, also designated SEQ ID:4541.

[60797] Another function of VGAM1830 is therefore inhibition of LOC124045 (Accession XM\_071873). Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124045. LOC51279 (Accession NM\_016546) is another VGAM1830 host target gene. LOC51279 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51279, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:18614, to the nucleotide sequence of VGAM1830 RNA, herein designated VGAM RNA, also designated SEQ ID:4541.

[60798] Another function of VGAM1830 is therefore inhibition of LOC51279 (Accession NM\_016546). Accordingly, utilities of VGAM1830 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1831 (VGAM1831) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60799] VGAM1831 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1831 was detected is described hereinabove with reference to Figs. 1–8.

[60800] VGAM1831 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1831 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[60801] VGAM1831 gene encodes a VGAM1831 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1831 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1831 precursor RNA is designated SEQ ID:1817, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1817 is located at position 40965 relative to the genome of Camelpox Virus.

[60802] VGAM1831 precursor RNA folds onto itself, forming VGAM1831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60803] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1831 folded precursor RNA into VGAM1831

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1831 RNA is designated SEQ ID:4542, and is provided hereinbelow with reference to the sequence listing part.

[60804] VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1831 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60805] VGAM1831 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1831 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1831 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60806] The complementary binding of VGAM1831 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1831 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1831 host target RNA into VGAM1831 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[60807] It is appreciated that VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1831 host target genes. The mRNA of each one of this plurality of VGAM1831 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1831 RNA, herein designated VGAM RNA, and which when bound by VGAM1831 RNA causes inhibition of translation of respective one or more VGAM1831 host target proteins.

[60808] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1831 gene, herein designated VGAM GENE, on one or more VGAM1831 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60809] It is yet further appreciated that a function of VGAM1831 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1831 correlate with, and may be deduced from, the identity of the host target genes which VGAM1831 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60810] Nucleotide sequences of the VGAM1831 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1831 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1831 are further described hereinbelow with reference to Table 1.

[60811] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1831 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1831 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60812] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1831 gene, herein designated VGAM is inhibition of expression of VGAM1831 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1831 correlate with, and may be deduced from, the identity of the target genes which VGAM1831 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60813] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM\_004776) is a VGAM1831 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11170, to the nucleotide

sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60814] A function of VGAM1831 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM\_004776). Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT5. BCL2-antagonist/killer 1 (BAK1, Accession XM\_166333) is another VGAM1831 host target gene. BAK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAK1 BINDING SITE, designated SEQ ID:44175, to the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60815] Another function of VGAM1831 is therefore inhibition of BCL2-antagonist/killer 1 (BAK1, Accession XM\_166333), a gene which accelerates programmed cell death by binding to, and antagonizing the a repressor bcl-2. Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with BAK1. The function of BAK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.Forkhead Box O1A

(rhabdomyosarcoma) (FOXO1A, Accession NM\_002015) is another VGAM1831 host target gene. FOXO1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXO1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:7758, to the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60816] Another function of VGAM1831 is therefore inhibition of Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM\_002015), a gene which is a probable transcription factor. Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO1A. The function of FOXO1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM228.Angiomotin Like 2 (AMOTL2, Accession NM\_016201) is another VGAM1831 host target gene. AMOTL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMOTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL2 BINDING SITE, designated SEQ ID:18293, to the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60817] Another function of VGAM1831 is therefore inhibition of Angiomotin Like 2 (AMOTL2, Accession NM\_016201). Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL2. FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016) is another VGAM1831 host target gene. FUSIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUSIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUSIP1 BIND-

ING SITE, designated SEQ ID:27624, to the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60818] Another function of VGAM1831 is therefore inhibition of FUS Interacting Protein (serine-arginine rich) 1 (FUSIP1, Accession NM\_054016). Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUSIP1. MGC10999 (Accession NM\_032307) is another VGAM1831 host target gene. MGC10999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10999 BINDING SITE, designated SEQ ID:26090, to the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60819] Another function of VGAM1831 is therefore inhibition of MGC10999 (Accession NM\_032307). Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10999. LOC153259 (Accession XM\_098342) is an-

other VGAM1831 host target gene. LOC153259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153259 BINDING SITE, designated SEQ ID:41600, to the nucleotide sequence of VGAM1831 RNA, herein designated VGAM RNA, also designated SEQ ID:4542.

[60820] Another function of VGAM1831 is therefore inhibition of LOC153259 (Accession XM\_098342). Accordingly, utilities of VGAM1831 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1832 (VGAM1832) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60821] VGAM1832 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1832 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[60822] VGAM1832 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60823] VGAM1832 gene encodes a VGAM1832 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1832 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1832 precursor RNA is designated SEQ ID:1818, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1818 is located at position 38937 relative to the genome of Camelpox Virus.

[60824] VGAM1832 precursor RNA folds onto itself, forming VGAM1832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60825] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1832 folded precursor RNA into VGAM1832 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1832 RNA is designated SEQ ID:4543, and is provided hereinbelow with reference to the sequence listing part.

[60826] VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1832 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60827] VGAM1832 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1832 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1832 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1832 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60828] The complementary binding of VGAM1832 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1832 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1832 host target RNA into VGAM1832 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60829] It is appreciated that VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1832 host target genes. The mRNA of each one of this plurality of VGAM1832 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1832 RNA, herein designated VGAM RNA, and which when bound by VGAM1832 RNA causes inhibition of translation of respective one or more VGAM1832 host target proteins.

[60830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1832 gene, herein designated VGAM GENE, on one or more VGAM1832 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60831] It is yet further appreciated that a function of VGAM1832 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1832 correlate with, and may be deduced from, the identity of the host target genes which VGAM1832 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60832] Nucleotide sequences of the VGAM1832 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1832 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1832 are further described hereinbelow with reference to Table 1.

[60833] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1832 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1832 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60834] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1832 gene, herein designated VGAM is inhibition of expression of VGAM1832 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1832 correlate with, and may be deduced from, the identity of the target genes which VGAM1832 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60835] GA (Accession NM\_013267) is a VGAM1832 host target gene. GA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of GA BINDING SITE, designated SEQ ID:14936, to the nucleotide sequence of VGAM1832 RNA, herein designated VGAM RNA, also designated SEQ ID:4543.

[60836] A function of VGAM1832 is therefore inhibition of GA (Accession NM\_013267). Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GA. KIAA0753 (Accession NM\_014804) is another VGAM1832 host target gene. KIAA0753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0753 BINDING SITE, designated SEQ ID:16737, to the nucleotide sequence of VGAM1832 RNA, herein designated VGAM RNA, also designated SEQ ID:4543.

[60837] Another function of VGAM1832 is therefore inhibition of KIAA0753 (Accession NM\_014804). Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0753. KIAA1130 (Accession XM\_031104) is another

VGAM1832 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31289, to the nucleotide sequence of VGAM1832 RNA, herein designated VGAM RNA, also designated SEQ ID:4543.

[60838] Another function of VGAM1832 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. Ribosomal Protein L36 (RPL36, Accession NM\_015414) is another VGAM1832 host target gene. RPL36 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RPL36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL36 BINDING SITE, designated SEQ ID:17715, to the nucleotide sequence of VGAM1832 RNA, herein designated VGAM RNA, also designated SEQ

ID:4543.

[60839] Another function of VGAM1832 is therefore inhibition of Ribosomal Protein L36 (RPL36, Accession NM\_015414). Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL36. LOC56920 (Accession NM\_020163) is another VGAM1832 host target gene. LOC56920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56920 BINDING SITE, designated SEQ ID:21381, to the nucleotide sequence of VGAM1832 RNA, herein designated VGAM RNA, also designated SEQ ID:4543.

[60840] Another function of VGAM1832 is therefore inhibition of LOC56920 (Accession NM\_020163). Accordingly, utilities of VGAM1832 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56920. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1833 (VGAM1833) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60841] VGAM1833 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1833 was detected is described hereinabove with reference to Figs. 1–8.

[60842] VGAM1833 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60843] VGAM1833 gene encodes a VGAM1833 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1833 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1833 precursor RNA is designated SEQ ID:1819, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1819 is located at position 38839 relative to the genome of Camelpox Virus.

[60844] VGAM1833 precursor RNA folds onto itself, forming VGAM1833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60845] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1833 folded precursor RNA into VGAM1833 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1833 RNA is designated SEQ ID:4544, and is provided hereinbelow with reference to the sequence listing part.

[60846] VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1833 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1833 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60847] VGAM1833 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1833 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1833 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[60848] The complementary binding of VGAM1833 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1833 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1833 host target RNA into VGAM1833 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60849] It is appreciated that VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1833 host target genes. The mRNA of each one of this plurality of VGAM1833 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1833 RNA, herein designated VGAM RNA, and which when bound by VGAM1833 RNA causes inhibition of translation of respective one or more VGAM1833 host target proteins.

[60850] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1833 gene, herein designated VGAM GENE, on one or more VGAM1833 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60851] It is yet further appreciated that a function of VGAM1833 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1833 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1833 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60852] Nucleotide sequences of the VGAM1833 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1833 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1833 are further described hereinbelow with reference to Table 1.

[60853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1833 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1833 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60854] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1833 gene, herein designated VGAM is inhibition of expression of VGAM1833 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1833 correlate with, and may be deduced from, the identity of the target genes which VGAM1833

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60855] Carbonic Anhydrase XII (CA12, Accession NM\_001218) is a VGAM1833 host target gene. CA12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CA12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE, designated SEQ ID:6881, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60856] A function of VGAM1833 is therefore inhibition of Carbonic Anhydrase XII (CA12, Accession NM\_001218), a gene which functions in cellular transport and metabolic processes. Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA12. The function of CA12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508. Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM\_035453) is another VGAM1833

host target gene. CLASP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLASP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP2 BINDING SITE, designated SEQ ID:32270, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60857] Another function of VGAM1833 is therefore inhibition of Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM\_035453), a gene which is involved in the regional regulation of microtubule dynamics in motile fibroblasts. Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP2. The function of CLASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM897.G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490) is another VGAM1833 host target gene. GPR48 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPR48, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:20549, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60858] Another function of VGAM1833 is therefore inhibition of G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490), a gene which binds to follicle-stimulating hormone and thyroid-stimulating hormone. Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR48. The function of GPR48 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM376. Ladinin 1 (LAD1, Accession NM\_005558) is another VGAM1833 host target gene. LAD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAD1 BINDING SITE, designated SEQ ID:12083,

to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60859] Another function of VGAM1833 is therefore inhibition of Ladinin 1 (LAD1, Accession NM\_005558). Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAD1. Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM\_020472) is another VGAM1833 host target gene. PIGA BINDING SITE1 and PIGA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1 and PIGA BINDING SITE2, designated SEQ ID:21710 and SEQ ID:21717 respectively, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60860] Another function of VGAM1833 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM\_020472). Accordingly, utilities of VGAM1833 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PIGA. Exportin 1 (CRM1 homolog, yeast) (XPO1, Accession NM\_003400) is another VGAM1833 host target gene. XPO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XPO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPO1 BINDING SITE, designated SEQ ID:9436, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60861] Another function of VGAM1833 is therefore inhibition of Exportin 1 (CRM1 homolog, yeast) (XPO1, Accession NM\_003400), a gene which is the cell cycle-regulated nuclear export protein 1. Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPO1. The function of XPO1 has been established by previous studies. Human CRM1, or XPO1, is the homolog of yeast crm1 (named for 'required for chromosome region maintenance'), a nuclear protein essential for proliferation and chromosome region maintenance. Fornerod et al. (1997) used the oncogenic

nucleoporin CAN (OMIM Ref. No. 114350) to coprecipitate human CRM1. The complete cDNA encodes a predicted protein of 1,071 amino acids with a predicted molecular mass of 123 kD. The CRM1 protein migrates at 112 kD. Human CRM1 has 47% identity with *S. cerevisiae* crm1 and 52% identity with *S. pombe* crm1+. The N terminus of human CRM1 shares significant homology with the N terminus of importin-beta. Fornerod et al. (1997) identified a group of largely uncharacterized yeast and vertebrate proteins of similar size (110 to 120 kD) that share this homology domain, which they proposed to call the CRIME domain (for 'CRM1, importin-beta, etc.'). Kudo et al. (1997) cloned human CRM1 cDNA using sequence information from EST databases and a PCR-based strategy based on the sequence of *S. pombe* crm1+. Northern blot analysis using the C-terminal region of human CRM1 cDNA as a probe revealed a major transcript of 5.6 kb expressed in all tissues tested except kidney. Human CRM1 weakly complemented the cold-sensitive mutation of *S. pombe* crm1-809. Overproduction of human CRM1 suppressed cell proliferation in wildtype *S. pombe* in an expression level-dependent manner. Overexpression of native *S. pombe* crm1+ had the same effect. Northern blot

analysis with RNAs isolated from synchronized mammalian cells showed that the expression of mammalian CRM1 was initiated in the late G1 phase and reached a peak at G2/M, although the protein level did not change during the cell cycle. Human CRM1 fused to green fluorescent protein (GFP) and transiently expressed in NIH 3T3 cells showed that human CRM1 was localized preferentially in the nuclear envelope, but was also detectable in the nucleoplasm and the cytoplasm. A *crm1* mutation of *S. pombe* caused nuclear import of a GFP fusion protein containing a nuclear export signal (NES) but no change in the distribution of a GFP fusion protein containing a nuclear localization signal (NLS). These data suggested to Kudo et al. (1997) that CRM1 is a novel cell cycle-regulated gene that is essential for the NES-dependent nuclear export of proteins.

[60862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[60863] Fornerod, M.; van Duersen, J.; van Baal, S.; Reynolds, A.; Davis, D.; Murti, K. G.; Fransen, J.; Grosveld, G. : The human homologue of yeast CRM1 is in a dynamic subcomplex with CAN/Nup214 and a novel nuclear pore compo-

nent Nup88. EMBO J. 16: 807–816, 1997. ; and

[60864] Kudo, N.; Khochbin, S.; Nishi, K.; Kitano, K.; Yanagida, M.; Yoshida, M.; Horinouchi, S. : Molecular cloning and cell cycle–dependent expression of mammalian CRM1, a protein involved in.

[60865] Further studies establishing the function and utilities of XPO1 are found in John Hopkins OMIM database record ID 602559, and in cited publications numbered 5912, 12100–633 and 9267 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0368 (Accession XM\_036708) is another VGAM1833 host target gene. KIAA0368 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0368 BINDING SITE, designated SEQ ID:32487, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60866] Another function of VGAM1833 is therefore inhibition of KIAA0368 (Accession XM\_036708). Accordingly, utilities of VGAM1833 include diagnosis, prevention and treat–

ment of diseases and clinical conditions associated with KIAA0368. KIAA1018 (Accession NM\_014967) is another VGAM1833 host target gene. KIAA1018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1018 BINDING SITE, designated SEQ ID:17358, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60867] Another function of VGAM1833 is therefore inhibition of KIAA1018 (Accession NM\_014967). Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1018. KIAA1576 (Accession XM\_038186) is another VGAM1833 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32769, to the

nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60868] Another function of VGAM1833 is therefore inhibition of KIAA1576 (Accession XM\_038186). Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM\_014820) is another VGAM1833 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:16791, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60869] Another function of VGAM1833 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM\_014820). Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A. LOC158527 (Accession

XM\_088594) is another VGAM1833 host target gene.

LOC158527 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158527 BINDING SITE, designated SEQ ID:39862, to the nucleotide sequence of VGAM1833 RNA, herein designated VGAM RNA, also designated SEQ ID:4544.

[60870] Another function of VGAM1833 is therefore inhibition of LOC158527 (Accession XM\_088594). Accordingly, utilities of VGAM1833 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158527. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1834 (VGAM1834) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60871] VGAM1834 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1834 was detected is described hereinabove with reference to Figs. 1–8.

[60872] VGAM1834 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60873] VGAM1834 gene encodes a VGAM1834 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1834 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1834 precursor RNA is designated SEQ ID:1820, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1820 is located at position 36702 relative to the genome of Camelpox Virus.

[60874] VGAM1834 precursor RNA folds onto itself, forming VGAM1834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60875] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1834 folded precursor RNA into VGAM1834 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1834 RNA is designated SEQ ID:4545, and is provided hereinbelow with reference to the sequence listing part.

[60876] VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1834 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60877] VGAM1834 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1834 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1834 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60878] The complementary binding of VGAM1834 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1834 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1834 host target RNA into VGAM1834 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60879] It is appreciated that VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1834 host target genes. The mRNA of each one of this plurality of VGAM1834 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1834 RNA, herein designated VGAM RNA, and which when bound by VGAM1834 RNA causes inhibition of translation of respective one or more VGAM1834 host target proteins.

[60880] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1834 gene, herein designated VGAM GENE, on one or more VGAM1834 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60881] It is yet further appreciated that a function of VGAM1834 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1834 correlate with, and may be deduced from, the identity of the host target genes which VGAM1834 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60882] Nucleotide sequences of the VGAM1834 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1834 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1834 are further described hereinbelow with reference to Table 1.

[60883] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1834 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1834 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60884] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1834 gene, herein designated VGAM is inhibition of expression of VGAM1834 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1834 correlate with, and may be deduced from, the identity of the target genes which VGAM1834 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60885] E2F Transcription Factor 3 (E2F3, Accession NM\_001949) is a VGAM1834 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:7670, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60886] A function of VGAM1834 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM\_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.Homeo Box B3 (HOXB3, Accession NM\_002146) is another VGAM1834 host target gene. HOXB3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HOXB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB3 BINDING SITE, designated SEQ ID:7924, to the nu-

cleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60887] Another function of VGAM1834 is therefore inhibition of Homeo Box B3 (HOXB3, Accession NM\_002146). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB3. Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM\_003889) is another VGAM1834 host target gene. NR1I2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR1I2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I2 BINDING SITE, designated SEQ ID:9975, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60888] Another function of VGAM1834 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM\_003889), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM1834 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM336. Neural Retina Leucine Zipper (NRL, Accession NM\_006177) is another VGAM1834 host target gene. NRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRL BINDING SITE, designated SEQ ID:12840, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60889] Another function of VGAM1834 is therefore inhibition of Neural Retina Leucine Zipper (NRL, Accession NM\_006177), a gene which has a basic motif and a leucine zipper domain similar to jun and fos. Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRL. The function of NRL and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM419. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694) is another VGAM1834 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28947, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60890] Another function of VGAM1834 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM\_138694). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038) is another VGAM1834 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:9000, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60891] Another function of VGAM1834 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859.BCMP1 (Accession NM\_031442) is another VGAM1834 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of BCMP1 BINDING SITE, designated SEQ ID:25460, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60892] Another function of VGAM1834 is therefore inhibition of BCMP1 (Accession NM\_031442). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. DIM1 (Accession NM\_006701) is another VGAM1834 host target gene. DIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIM1 BINDING SITE, designated SEQ ID:13525, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60893] Another function of VGAM1834 is therefore inhibition of DIM1 (Accession NM\_006701). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIM1. FLJ10738 (Accession NM\_018199) is another VGAM1834

host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:20071, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60894] Another function of VGAM1834 is therefore inhibition of FLJ10738 (Accession NM\_018199). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10738. KIAA0040 (Accession NM\_014656) is another VGAM1834 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16101, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60895] Another function of VGAM1834 is therefore inhibition of KIAA0040 (Accession NM\_014656). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. KIAA0261 (Accession XM\_042946) is another VGAM1834 host target gene. KIAA0261 BINDING SITE1 and KIAA0261 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0261, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE1 and KIAA0261 BINDING SITE2, designated SEQ ID:33831 and SEQ ID:33837 respectively, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60896] Another function of VGAM1834 is therefore inhibition of KIAA0261 (Accession XM\_042946). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. LOC149842 (Accession XM\_097745) is another VGAM1834 host target gene. LOC149842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC149842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149842 BINDING SITE, designated SEQ ID:41093, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60897] Another function of VGAM1834 is therefore inhibition of LOC149842 (Accession XM\_097745). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149842. LOC150967 (Accession XM\_087060) is another VGAM1834 host target gene. LOC150967 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150967, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150967 BINDING SITE, designated SEQ ID:39038, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60898] Another function of VGAM1834 is therefore inhibition of LOC150967 (Accession XM\_087060). Accordingly, utilities

of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150967. LOC152503 (Accession XM\_098238) is another VGAM1834 host target gene. LOC152503 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152503 BINDING SITE, designated SEQ ID:41520, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60899] Another function of VGAM1834 is therefore inhibition of LOC152503 (Accession XM\_098238). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152503. LOC221495 (Accession XM\_168136) is another VGAM1834 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221495 BINDING SITE, designated SEQ ID:45063, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60900] Another function of VGAM1834 is therefore inhibition of LOC221495 (Accession XM\_168136). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC221935 (Accession XM\_166537) is another VGAM1834 host target gene. LOC221935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44504, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60901] Another function of VGAM1834 is therefore inhibition of LOC221935 (Accession XM\_166537). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC254100 (Accession XM\_172851) is another VGAM1834 host target gene. LOC254100 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254100 BINDING SITE, designated SEQ ID:46129, to the nucleotide sequence of VGAM1834 RNA, herein designated VGAM RNA, also designated SEQ ID:4545.

[60902] Another function of VGAM1834 is therefore inhibition of LOC254100 (Accession XM\_172851). Accordingly, utilities of VGAM1834 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254100. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1835 (VGAM1835) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60903] VGAM1835 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1835 was detected is described hereinabove with reference to Figs. 1-8.

[60904] VGAM1835 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60905] VGAM1835 gene encodes a VGAM1835 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1835 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1835 precursor RNA is designated SEQ ID:1821, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1821 is located at position 136546 relative to the genome of Fowlpox Virus.

[60906] VGAM1835 precursor RNA folds onto itself, forming VGAM1835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[60907] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1835 folded precursor RNA into VGAM1835 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1835 RNA is designated SEQ ID:4546, and is provided hereinbelow with reference to the sequence listing part.

[60908] VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1835 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60909] VGAM1835 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1835 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1835 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1835 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[60910] The complementary binding of VGAM1835 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1835 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1835 host target RNA into VGAM1835 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60911] It is appreciated that VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1835 host target genes. The mRNA of each one of this plurality of VGAM1835 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1835 RNA, herein designated VGAM RNA, and which when bound by VGAM1835 RNA causes inhibition of translation of respective one or more VGAM1835 host target proteins.

[60912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1835 gene, herein designated VGAM GENE, on one or more VGAM1835 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60913] It is yet further appreciated that a function of VGAM1835 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1835 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1835 correlate with, and may be deduced from, the identity of the host target genes which VGAM1835 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60914] Nucleotide sequences of the VGAM1835 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1835 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1835 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1835 are further described hereinbelow with reference to Table 1.

[60915] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1835 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1835 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60916] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1835 gene, herein designated VGAM is inhibition of expression of VGAM1835 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1835 correlate with, and may be deduced from, the identity of the target genes which VGAM1835 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60917] Dihydropyrimidinase-like 3 (DPYSL3, Accession NM\_001387) is a VGAM1835 host target gene. DPYSL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYSL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of DPYSL3 BINDING SITE, designated SEQ ID:7068, to the nucleotide sequence of VGAM1835 RNA, herein designated VGAM RNA, also designated SEQ ID:4546.

[60918] A function of VGAM1835 is therefore inhibition of Dihydropyrimidinase-like 3 (DPYSL3, Accession NM\_001387), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM1835 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL3. The function of DPYSL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1836 (VGAM1836) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60919] VGAM1836 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1836 was detected is described hereinabove with reference to Figs. 1–8.

[60920] VGAM1836 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60921] VGAM1836 gene encodes a VGAM1836 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1836 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1836 precursor RNA is designated SEQ ID:1822, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1822 is located at position 140071 relative to the genome of Fowlpox Virus.

[60922] VGAM1836 precursor RNA folds onto itself, forming VGAM1836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[60923] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1836 folded precursor RNA into VGAM1836 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1836 RNA is designated SEQ ID:4547, and is provided hereinbelow with reference to the sequence listing part.

[60924] VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1836 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60925] VGAM1836 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1836 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1836 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1836 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60926] The complementary binding of VGAM1836 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1836 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1836 host target RNA into VGAM1836 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60927] It is appreciated that VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1836 host target genes. The mRNA of each one of this plurality of VGAM1836 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1836 RNA, herein designated VGAM RNA, and which when bound by VGAM1836 RNA causes inhibition of translation of respective one or more VGAM1836 host target proteins.

[60928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1836 gene, herein designated VGAM GENE, on one or more VGAM1836 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60929] It is yet further appreciated that a function of VGAM1836 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1836 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1836 correlate with, and may be deduced from, the identity of the host target genes which VGAM1836 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60930] Nucleotide sequences of the VGAM1836 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1836 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1836 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1836 are further described hereinbelow with reference to Table 1.

[60931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1836 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1836 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60932] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1836 gene, herein designated VGAM is inhibition of expression of VGAM1836 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1836 correlate with, and may be deduced from, the identity of the target genes which VGAM1836 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60933] KIAA1856 (Accession XM\_166549) is a VGAM1836 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44526, to the nucleotide sequence of VGAM1836 RNA, herein designated VGAM RNA, also designated SEQ ID:4547.

[60934] A function of VGAM1836 is therefore inhibition of KIAA1856 (Accession XM\_166549). Accordingly, utilities of VGAM1836 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1856. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1837 (VGAM1837) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60935] VGAM1837 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1837 was detected is described hereinabove with reference to Figs. 1–8.

[60936] VGAM1837 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[60937] VGAM1837 gene encodes a VGAM1837 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1837 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1837 precursor RNA is designated SEQ ID:1823, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1823 is located at position 133890 relative to the genome of Fowlpox Virus.

[60938] VGAM1837 precursor RNA folds onto itself, forming VGAM1837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60939] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1837 folded precursor RNA into VGAM1837 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1837 RNA is designated SEQ ID:4548, and is provided hereinbelow with reference to the sequence listing part.

[60940] VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1837 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60941] VGAM1837 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1837 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1837 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60942] The complementary binding of VGAM1837 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1837 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1837 host target RNA into VGAM1837 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60943] It is appreciated that VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1837 host target genes. The mRNA of each one of this plurality of VGAM1837 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1837 RNA, herein designated VGAM RNA, and which when bound by VGAM1837 RNA causes inhibition of translation of respective one or more VGAM1837 host target proteins.

[60944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1837 gene, herein designated VGAM GENE, on one or more VGAM1837 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60945] It is yet further appreciated that a function of VGAM1837 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1837 correlate with, and may be deduced from, the identity of the host target genes which VGAM1837 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60946] Nucleotide sequences of the VGAM1837 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1837 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1837 are further described hereinbelow with reference to Table 1.

[60947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1837 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1837 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60948] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1837 gene, herein designated VGAM is inhibition of expression of VGAM1837 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1837 correlate with, and may be deduced from, the identity of the target genes which VGAM1837 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60949] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141) is a VGAM1837 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15413, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ

ID:4548.

[60950] A function of VGAM1837 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM\_014141). Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. G Protein-coupled Receptor 65 (GPR65, Accession XM\_007392) is another VGAM1837 host target gene. GPR65 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR65 BINDING SITE, designated SEQ ID:30051, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ ID:4548.

[60951] Another function of VGAM1837 is therefore inhibition of G Protein-coupled Receptor 65 (GPR65, Accession XM\_007392). Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR65. Neurexin 1 (NRXN1, Accession NM\_138735) is another VGAM1837 host target gene. NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2

are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2, designated SEQ ID:28992 and SEQ ID:11221 respectively, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ ID:4548.

[60952] Another function of VGAM1837 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM\_138735), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Ectonucleotide Pyrophosphatase/phosphodiesterase 4 (putative function) (ENPP4, Accession NM\_014936) is another VGAM1837 host target gene. ENPP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENPP4,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENPP4 BINDING SITE, designated SEQ ID:17239, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ ID:4548.

[60953] Another function of VGAM1837 is therefore inhibition of Ectonucleotide Pyrophosphatase/phosphodiesterase 4 (putative function) (ENPP4, Accession NM\_014936). Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENPP4. LOC148824 (Accession XM\_097527) is another VGAM1837 host target gene. LOC148824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148824 BINDING SITE, designated SEQ ID:40909, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ ID:4548.

[60954] Another function of VGAM1837 is therefore inhibition of LOC148824 (Accession XM\_097527). Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824. LOC153711 (Accession XM\_098419) is another VGAM1837 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41665, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ ID:4548.

[60955] Another function of VGAM1837 is therefore inhibition of LOC153711 (Accession XM\_098419). Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC253664 (Accession XM\_170673) is another VGAM1837 host target gene. LOC253664 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253664, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253664 BINDING SITE, designated SEQ ID:45446, to the nucleotide sequence of VGAM1837 RNA, herein designated VGAM RNA, also designated SEQ ID:4548.

[60956] Another function of VGAM1837 is therefore inhibition of LOC253664 (Accession XM\_170673). Accordingly, utilities of VGAM1837 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253664. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1838 (VGAM1838) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60957] VGAM1838 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1838 was detected is described hereinabove with reference to Figs. 1-8.

[60958] VGAM1838 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1838 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[60959] VGAM1838 gene encodes a VGAM1838 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1838 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1838 precursor RNA is designated SEQ ID:1824, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1824 is located at position 131052 relative to the genome of Fowlpox Virus.

[60960] VGAM1838 precursor RNA folds onto itself, forming VGAM1838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60961] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1838 folded precursor RNA into VGAM1838

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1838 RNA is designated SEQ ID:4549, and is provided hereinbelow with reference to the sequence listing part.

[60962] VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1838 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60963] VGAM1838 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1838 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1838 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60964] The complementary binding of VGAM1838 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1838 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1838 host target RNA into VGAM1838 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[60965] It is appreciated that VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1838 host target genes. The mRNA of each one of this plurality of VGAM1838 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1838 RNA, herein designated VGAM RNA, and which when bound by VGAM1838 RNA causes inhibition of translation of respective one or more VGAM1838 host target proteins.

[60966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1838 gene, herein designated VGAM GENE, on one or more VGAM1838 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60967] It is yet further appreciated that a function of VGAM1838 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1838 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1838 correlate with, and may be deduced from, the identity of the host target genes which VGAM1838 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60968] Nucleotide sequences of the VGAM1838 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1838 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1838 are further described hereinbelow with reference to Table 1.

[60969] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1838 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1838 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60970] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1838 gene, herein designated VGAM is inhibition of expression of VGAM1838 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1838 correlate with, and may be deduced from, the identity of the target genes which VGAM1838 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60971] Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000028) is a VGAM1838 host target gene. AGL BINDING SITE1 through AGL BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING

SITE1 through AGL BINDING SITE6, designated SEQ ID:5466, SEQ ID:6305, SEQ ID:6298, SEQ ID:6293, SEQ ID:6288 and SEQ ID:6283 respectively, to the nucleotide sequence of VGAM1838 RNA, herein designated VGAM RNA, also designated SEQ ID:4549.

[60972] A function of VGAM1838 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000028). Accordingly, utilities of VGAM1838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL. Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967) is another VGAM1838 host target gene. SNTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTG1 BINDING SITE, designated SEQ ID:21039, to the nucleotide sequence of VGAM1838 RNA, herein designated VGAM RNA, also designated SEQ ID:4549.

[60973] Another function of VGAM1838 is therefore inhibition of Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967).

Accordingly, utilities of VGAM1838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG1. LOC133686 (Accession XM\_059667) is another VGAM1838 host target gene. LOC133686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133686 BINDING SITE, designated SEQ ID:37052, to the nucleotide sequence of VGAM1838 RNA, herein designated VGAM RNA, also designated SEQ ID:4549.

[60974] Another function of VGAM1838 is therefore inhibition of LOC133686 (Accession XM\_059667). Accordingly, utilities of VGAM1838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133686. LOC91301 (Accession XM\_037564) is another VGAM1838 host target gene. LOC91301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91301 BINDING SITE, designated SEQ ID:32649, to the nucleotide sequence of VGAM1838 RNA, herein designated VGAM RNA, also designated SEQ ID:4549.

[60975] Another function of VGAM1838 is therefore inhibition of LOC91301 (Accession XM\_037564). Accordingly, utilities of VGAM1838 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1839 (VGAM1839) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60976] VGAM1839 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1839 was detected is described hereinabove with reference to Figs. 1–8.

[60977] VGAM1839 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[60978] VGAM1839 gene encodes a VGAM1839 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1839 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1839 precursor RNA is designated SEQ ID:1825, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1825 is located at position 139769 relative to the genome of Fowlpox Virus.

[60979] VGAM1839 precursor RNA folds onto itself, forming VGAM1839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60980] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1839 folded precursor RNA into VGAM1839 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1839 RNA is designated SEQ ID:4550, and is provided hereinbelow with reference to the sequence listing part.

[60981] VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1839 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[60982] VGAM1839 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1839 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1839 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60983] The complementary binding of VGAM1839 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1839 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1839 host target RNA into VGAM1839 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[60984] It is appreciated that VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1839 host target genes. The mRNA of each one of this plurality of VGAM1839 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1839 RNA, herein designated VGAM RNA, and which when bound by VGAM1839 RNA causes inhibition of translation of respective one or more VGAM1839 host target proteins.

[60985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1839 gene, herein designated VGAM GENE, on one or more VGAM1839 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[60986] It is yet further appreciated that a function of VGAM1839 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1839 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1839 correlate with, and may be deduced from, the identity of the host target genes which VGAM1839 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[60987] Nucleotide sequences of the VGAM1839 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1839 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1839 are further described hereinbelow with reference to Table 1.

[60988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1839 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1839 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[60989] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1839 gene, herein designated VGAM is inhibition of expression of VGAM1839 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1839 correlate with, and may be deduced from, the identity of the target genes which VGAM1839 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[60990] FLJ20051 (Accession NM\_019087) is a VGAM1839 host target gene. FLJ20051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20051 BINDING SITE, designated SEQ ID:21163, to the nucleotide sequence of VGAM1839 RNA, herein designated VGAM RNA, also designated SEQ ID:4550.

[60991] A function of VGAM1839 is therefore inhibition of FLJ20051 (Accession NM\_019087). Accordingly, utilities of VGAM1839 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20051. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1840 (VGAM1840) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[60992] VGAM1840 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1840 was detected is described hereinabove with reference to Figs. 1–8.

[60993] VGAM1840 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Mottle Virus. VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[60994] VGAM1840 gene encodes a VGAM1840 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1840 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1840 precursor RNA is designated SEQ ID:1826, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1826 is located at position 998 relative to the genome of Cowpea Mottle Virus.

[60995] VGAM1840 precursor RNA folds onto itself, forming VGAM1840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[60996] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1840 folded precursor RNA into VGAM1840 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1840 RNA is designated SEQ ID:4551, and is provided hereinbelow with reference to the sequence listing part.

[60997] VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1840 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[60998] VGAM1840 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1840 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1840 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[60999] The complementary binding of VGAM1840 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1840 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1840 host target RNA into VGAM1840 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61000] It is appreciated that VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1840 host target genes. The mRNA of each one of this plurality of VGAM1840 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1840 RNA, herein designated VGAM RNA, and which when bound by VGAM1840 RNA causes inhibition of translation of respective one or more VGAM1840 host target proteins.

[61001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1840 gene, herein designated VGAM GENE, on one or more VGAM1840 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61002] It is yet further appreciated that a function of VGAM1840 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1840 include diagnosis, prevention and treatment of viral infection by Cowpea Mottle Virus. Specific functions, and accordingly utilities, of VGAM1840 correlate with, and may be deduced from, the identity of the host target genes which VGAM1840 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61003] Nucleotide sequences of the VGAM1840 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1840 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1840 are further described hereinbelow with reference to Table 1.

[61004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1840 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1840 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[61005] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1840 gene, herein designated VGAM is inhibition of expression of VGAM1840 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1840 correlate with, and may be deduced from, the identity of the target genes which VGAM1840 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61006] Testis Derived Transcript (3 LIM domains) (TES, Accession XM\_050430) is a VGAM1840 host target gene. TES BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TES BINDING SITE, designated SEQ ID:35632, to the nucleotide sequence of VGAM1840 RNA, herein designated VGAM RNA, also designated SEQ ID:4551.

[61007] A function of VGAM1840 is therefore inhibition of Testis Derived Transcript (3 LIM domains) (TES, Accession XM\_050430), a gene which acts as a tumor suppressor. Accordingly, utilities of VGAM1840 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with TES. The function of TES and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM363. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375) is another VGAM1840 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33509, to the nucleotide sequence of VGAM1840 RNA, herein designated VGAM RNA, also designated SEQ ID:4551.

[61008] Another function of VGAM1840 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375). Accordingly, utilities of VGAM1840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. SYNE-2 (Accession NM\_015180) is another VGAM1840 host target gene. SYNE-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SYNE-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNE-2 BINDING SITE, designated SEQ ID:17534, to the nucleotide sequence of VGAM1840 RNA, herein designated VGAM RNA, also designated SEQ ID:4551.

[61009] Another function of VGAM1840 is therefore inhibition of SYNE-2 (Accession NM\_015180). Accordingly, utilities of VGAM1840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNE-2. LOC121838 (Accession XM\_071772) is another VGAM1840 host target gene. LOC121838 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121838 BINDING SITE, designated SEQ ID:37417, to the nucleotide sequence of VGAM1840 RNA, herein designated VGAM RNA, also designated SEQ ID:4551.

[61010] Another function of VGAM1840 is therefore inhibition of LOC121838 (Accession XM\_071772). Accordingly, utilities

of VGAM1840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121838. LOC158337 (Accession XM\_098926) is another VGAM1840 host target gene. LOC158337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158337 BINDING SITE, designated SEQ ID:41960, to the nucleotide sequence of VGAM1840 RNA, herein designated VGAM RNA, also designated SEQ ID:4551.

[61011] Another function of VGAM1840 is therefore inhibition of LOC158337 (Accession XM\_098926). Accordingly, utilities of VGAM1840 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1841 (VGAM1841) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61012] VGAM1841 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1841 was detected is described hereinabove with reference to Figs. 1–8.

[61013] VGAM1841 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Mottle Virus. VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61014] VGAM1841 gene encodes a VGAM1841 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1841 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1841 precursor RNA is designated SEQ ID:1827, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1827 is located at position 695 relative to the genome of Cowpea Mottle Virus.

[61015] VGAM1841 precursor RNA folds onto itself, forming VGAM1841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61016] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1841 folded precursor RNA into VGAM1841 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1841 RNA is designated SEQ ID:4552, and is provided hereinbelow with reference to the sequence listing part.

[61017] VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1841 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[61018] VGAM1841 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1841 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1841 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61019] The complementary binding of VGAM1841 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1841 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1841 host target RNA into VGAM1841 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61020] It is appreciated that VGAM1841 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1841 host target genes. The mRNA of each one of this plurality of VGAM1841 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1841 RNA, herein designated VGAM RNA, and which when bound by VGAM1841 RNA causes inhibition of translation of respective one or more VGAM1841 host target proteins.

[61021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1841 gene, herein designated VGAM GENE, on one or more VGAM1841 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61022] It is yet further appreciated that a function of VGAM1841 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of viral infection by Cowpea Mottle Virus. Specific functions, and accordingly utilities, of VGAM1841 correlate with, and may be deduced from, the identity of the host target genes which VGAM1841 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61023] Nucleotide sequences of the VGAM1841 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1841 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1841 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1841 are further  
described hereinbelow with reference to Table 1.

[61024] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1841 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1841 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[61025] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1841 gene, herein designated VGAM is  
inhibition of expression of VGAM1841 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1841 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1841  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[61026] Ankyrin Repeat Domain 3 (ANKRD3, Accession  
NM\_020639) is a VGAM1841 host target gene. ANKRD3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKRD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKRD3 BINDING SITE, designated SEQ ID:21797, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61027] A function of VGAM1841 is therefore inhibition of Ankyrin Repeat Domain 3 (ANKRD3, Accession NM\_020639). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD3. Drebrin 1 (DBN1, Accession NM\_004395) is another VGAM1841 host target gene. DBN1 BINDING SITE1 and DBN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DBN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBN1 BINDING SITE1 and DBN1 BINDING SITE2, designated SEQ ID:10638 and SEQ ID:28121 respectively, to the nucleotide sequence of

VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61028] Another function of VGAM1841 is therefore inhibition of Drebrin 1 (DBN1, Accession NM\_004395). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBN1. Thrombomodulin (THBD, Accession NM\_000361) is another VGAM1841 host target gene. THBD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by THBD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE, designated SEQ ID:5918, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61029] Another function of VGAM1841 is therefore inhibition of Thrombomodulin (THBD, Accession NM\_000361). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD. DKFZP727M111 (Accession NM\_015540) is another VGAM1841 host target gene. DKFZP727M111 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by DKFZP727M111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727M111 BINDING SITE, designated SEQ ID:17800, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61030] Another function of VGAM1841 is therefore inhibition of DKFZP727M111 (Accession NM\_015540). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727M111. KIAA0700 (Accession XM\_050561) is another VGAM1841 host target gene. KIAA0700 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0700 BINDING SITE, designated SEQ ID:35659, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61031] Another function of VGAM1841 is therefore inhibition of

KIAA0700 (Accession XM\_050561). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0700. LOC116166 (Accession XM\_007651) is another VGAM1841 host target gene. LOC116166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116166 BINDING SITE, designated SEQ ID:30060, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61032] Another function of VGAM1841 is therefore inhibition of LOC116166 (Accession XM\_007651). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116166. LOC158987 (Accession XM\_099015) is another VGAM1841 host target gene. LOC158987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158987 BINDING SITE, designated SEQ ID:42048, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61033] Another function of VGAM1841 is therefore inhibition of LOC158987 (Accession XM\_099015). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158987. LOC165904 (Accession XM\_093522) is another VGAM1841 host target gene. LOC165904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165904 BINDING SITE, designated SEQ ID:40195, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61034] Another function of VGAM1841 is therefore inhibition of LOC165904 (Accession XM\_093522). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165904. LOC90678 (Accession NM\_138361) is an-

other VGAM1841 host target gene. LOC90678 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90678 BINDING SITE, designated SEQ ID:28747, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61035] Another function of VGAM1841 is therefore inhibition of LOC90678 (Accession NM\_138361). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90678. LOC91807 (Accession XM\_040819) is another VGAM1841 host target gene. LOC91807 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91807, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91807 BINDING SITE, designated SEQ ID:33384, to the nucleotide sequence of VGAM1841 RNA, herein designated VGAM RNA, also designated SEQ ID:4552.

[61036] Another function of VGAM1841 is therefore inhibition of LOC91807 (Accession XM\_040819). Accordingly, utilities of VGAM1841 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91807. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1842 (VGAM1842) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61037] VGAM1842 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1842 was detected is described hereinabove with reference to Figs. 1-8.

[61038] VGAM1842 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61039] VGAM1842 gene encodes a VGAM1842 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1842 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1842 precursor RNA is designated SEQ ID:1828, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1828 is located at position 19726 relative to the genome of Chimpanzee Cytomegalovirus.

[61040] VGAM1842 precursor RNA folds onto itself, forming VGAM1842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61041] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1842 folded precursor RNA into VGAM1842 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1842 RNA is designated SEQ ID:4553, and is provided hereinbelow with reference to the sequence listing part.

[61042] VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1842 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[61043] VGAM1842 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1842 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1842 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61044] The complementary binding of VGAM1842 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1842 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1842 host target RNA into VGAM1842 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61045] It is appreciated that VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1842 host target genes. The mRNA of each one of this plurality of VGAM1842 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1842 RNA, herein designated VGAM RNA, and which when bound by VGAM1842 RNA causes inhibition of translation of respective one or more VGAM1842 host target proteins.

[61046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1842 gene, herein designated VGAM GENE, on one or more VGAM1842 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61047] It is yet further appreciated that a function of VGAM1842 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1842 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1842 correlate with, and may be deduced from, the identity of the host target genes which VGAM1842 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61048] Nucleotide sequences of the VGAM1842 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1842 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1842 are further described hereinbelow with reference to Table 1.

[61049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1842 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1842 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[61050] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1842 gene, herein designated VGAM is inhibition of expression of VGAM1842 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1842 correlate with, and may be deduced from, the identity of the target genes which VGAM1842 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61051] Myelin Protein Zero (Charcot-Marie-Tooth neuropathy 1B) (MPZ, Accession NM\_000530) is a VGAM1842 host target gene. MPZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPZ BINDING SITE, designated SEQ ID:6130, to the nucleotide sequence of VGAM1842 RNA, herein designated VGAM RNA, also designated SEQ ID:4553.

[61052] A function of VGAM1842 is therefore inhibition of Myelin Protein Zero (Charcot-Marie-Tooth neuropathy 1B) (MPZ, Accession NM\_000530). Accordingly, utilities of VGAM1842 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MPZ. LOC147080 (Accession XM\_097182) is another VGAM1842 host target gene. LOC147080 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147080 BINDING SITE, designated SEQ ID:40796, to the nucleotide sequence of VGAM1842 RNA, herein designated VGAM RNA, also designated SEQ ID:4553.

[61053] Another function of VGAM1842 is therefore inhibition of LOC147080 (Accession XM\_097182). Accordingly, utilities of VGAM1842 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147080. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1843 (VGAM1843) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61054] VGAM1843 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1843 was detected is described hereinabove with reference to Figs. 1-8.

[61055] VGAM1843 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61056] VGAM1843 gene encodes a VGAM1843 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1843 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1843 precursor RNA is designated SEQ ID:1829, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1829 is located at position 14213 relative to the genome of Chimpanzee Cytomegalovirus.

[61057] VGAM1843 precursor RNA folds onto itself, forming VGAM1843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61058] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1843 folded precursor RNA into VGAM1843 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1843 RNA is designated SEQ ID:4554, and is provided hereinbelow with reference to the sequence listing part.

[61059] VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1843 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61060] VGAM1843 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1843 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1843 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61061] The complementary binding of VGAM1843 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1843 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1843 host target RNA into VGAM1843 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61062] It is appreciated that VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1843 host target genes. The mRNA of each one of this plurality of VGAM1843 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1843 RNA, herein designated VGAM RNA, and which when bound by VGAM1843 RNA causes inhibition of translation of respective one or more VGAM1843 host target proteins.

[61063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1843 gene, herein designated VGAM GENE, on one or more VGAM1843 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61064] It is yet further appreciated that a function of VGAM1843 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1843 correlate with, and may be deduced from, the identity of the host target genes which VGAM1843 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61065] Nucleotide sequences of the VGAM1843 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1843 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1843 are further described hereinbelow with reference to Table 1.

[61066] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1843 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1843 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61067] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1843 gene, herein designated VGAM is inhibition of expression of VGAM1843 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1843 correlate with, and may be deduced from, the identity of the target genes which VGAM1843 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61068] Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM\_000896) is a VGAM1843 host target gene. CYP4F3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP4F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4F3 BINDING SITE, designated SEQ ID:6591, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61069] A function of VGAM1843 is therefore inhibition of Cytochrome P450, Subfamily IVF, Polypeptide 3 (leukotriene B4 omega hydroxylase) (CYP4F3, Accession NM\_000896), a gene which converts leukotriene B4 into the less active 20-hydroxy-leukotriene B4. Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F3. The function of CYP4F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109) is another VGAM1843 host target gene. DMD BINDING SITE1 through DMD BINDING SITE13 are HOST TARGET binding sites found in untranslated regions of

mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE13, designated SEQ ID:5570, SEQ ID:10155, SEQ ID:10161, SEQ ID:10168, SEQ ID:10175, SEQ ID:10181, SEQ ID:10186, SEQ ID:10193, SEQ ID:10203, SEQ ID:10208, SEQ ID:10213, SEQ ID:10220 and SEQ ID:10232 respectively, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61070] Another function of VGAM1843 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109), a gene which muscular dystrophy . Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_023109) is another VGAM1843 host target

gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE3, designated SEQ ID:23372, SEQ ID:6207 and SEQ ID:6611 respectively, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61071] Another function of VGAM1843 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM\_023109). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646) is another VGAM1843 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PIK3C2B BINDING SITE, designated SEQ ID:8508, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61072] Another function of VGAM1843 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Regulator of G-protein Signalling 16 (RGS16, Accession NM\_002928) is another VGAM1843 host target gene. RGS16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS16 BINDING SITE, designated SEQ ID:8833, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61073] Another function of VGAM1843 is therefore inhibition of Regulator of G-protein Signalling 16 (RGS16, Accession NM\_002928), a gene which inhibits signal transduction.

Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS16. The function of RGS16 has been established by previous studies. Snow et al. (1998) found that the RGS16 gene contains 5 exons. Northern blot analysis revealed that RGS16 is expressed at high levels in retina and at lower levels in all other tissues examined. By searching for retinal-specific RGS family members that might be involved in the phototransduction cascade, Chen et al. (1996) identified cDNAs encoding the mouse and rat homologs of RGS16, called *Rgs-r* by them. Northern blot analysis showed that rat *Rgs16* is expressed predominantly in the retina. Chen et al. (1996) found that mouse *Rgs16* enhances the rate of GTP-hydrolysis by transducin (see OMIM Ref. No. GNAT2; 139340), suggesting that *Rgs16* may play a role in regulating the kinetics of signaling in the phototransduction cascade. The mouse and rat *Rgs16* proteins have 94% amino acid sequence identity. Snow et al. (1998) reported that the mouse and human RGS16 proteins have 86% amino acid sequence identity

[61074] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [61075] Snow, B. E.; Antonio, L.; Suggs, S.; Siderovski, D. P. : Cloning of a retinally abundant regulator of G-protein signaling (RGS-r/RGS16): genomic structure and chromosomal localization of the human gene. *Gene* 206: 247–253, 1998. ; and
- [61076] Chen, C.-K.; Wieland, T.; Simon, M. I. : RGS-r, a retinal specific RGS protein, binds an intermediate conformation of transducin and enhances recycling. *Proc. Nat. Acad. Sci.* 93: 12885–12888.
- [61077] Further studies establishing the function and utilities of RGS16 are found in John Hopkins OMIM database record ID 602514, and in cited publications numbered 8545–8548 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selectin P Ligand (SELPLG, Accession XM\_006867) is another VGAM1843 host target gene. SELPLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELPLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELPLG BINDING SITE, designated SEQ ID:30019, to the nucleotide se-

quence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61078] Another function of VGAM1843 is therefore inhibition of Selectin P Ligand (SELPLG, Accession XM\_006867), a gene which binds to p-, e- and l-selectins, which mediates the tethering and rolling of neutrophils and t-lymphocytes on endothelial cells. Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELPLG. The function of SELPLG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Small Glutamine-rich Tetratricopeptide Repeat (TPR)-containing (SGT, Accession NM\_003021) is another VGAM1843 host target gene. SGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGT BINDING SITE, designated SEQ ID:8942, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61079] Another function of VGAM1843 is therefore inhibition of Small Glutamine-rich Tetratricopeptide Repeat (TPR)-containing (SGT, Accession NM\_003021). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGT. Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983) is another VGAM1843 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10130, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61080] Another function of VGAM1843 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 6 (SLC7A6, Accession NM\_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM87.Tyrosinase-related Protein 1 (TYRP1, Accession XM\_051267) is another VGAM1843 host target gene.

TYRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TYRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TYRP1 BINDING SITE, designated SEQ ID:35797, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61081] Another function of VGAM1843 is therefore inhibition of Tyrosinase-related Protein 1 (TYRP1, Accession XM\_051267). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TYRP1. Cytochrome P450, Subfamily IVF, Polypeptide 2 (CYP4F2, Accession NM\_001082) is another VGAM1843 host target gene. CYP4F2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by CYP4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP4F2 BINDING SITE, designated SEQ ID:6742, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61082] Another function of VGAM1843 is therefore inhibition of Cytochrome P450, Subfamily IVF, Polypeptide 2 (CYP4F2, Accession NM\_001082). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP4F2. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681) is another VGAM1843 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16161, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4554.

[61083] Another function of VGAM1843 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 34 (DDX34, Accession NM\_014681). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DJ971N18.2 (Accession NM\_021156) is another VGAM1843 host target gene. DJ971N18.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ971N18.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ971N18.2 BINDING SITE, designated SEQ ID:22135, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61084] Another function of VGAM1843 is therefore inhibition of DJ971N18.2 (Accession NM\_021156). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ971N18.2. DKFZp547M072 (Accession XM\_028067) is another VGAM1843 host target gene. DKFZp547M072 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by DKFZp547M072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547M072 BINDING SITE, designated SEQ ID:30615, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61085] Another function of VGAM1843 is therefore inhibition of DKFZp547M072 (Accession XM\_028067). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547M072. DKFZP586M1120 (Accession NM\_031294) is another VGAM1843 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25322, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61086] Another function of VGAM1843 is therefore inhibition of DKFZP586M1120 (Accession NM\_031294). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. FLJ10751 (Accession NM\_018205) is another VGAM1843 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20092 and SEQ ID:20191 respectively, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61087] Another function of VGAM1843 is therefore inhibition of FLJ10751 (Accession NM\_018205). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. KIAA0342 (Accession XM\_047357) is another VGAM1843 host target gene. KIAA0342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA0342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0342 BINDING SITE, designated SEQ ID:34959, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61088] Another function of VGAM1843 is therefore inhibition of KIAA0342 (Accession XM\_047357). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0342. KIAA0478 (Accession NM\_014870) is another VGAM1843 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16978, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61089] Another function of VGAM1843 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities

of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1332 (Accession XM\_048774) is another VGAM1843 host target gene. KIAA1332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35256, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61090] Another function of VGAM1843 is therefore inhibition of KIAA1332 (Accession XM\_048774). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1529 (Accession XM\_047336) is another VGAM1843 host target gene. KIAA1529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1529 BINDING SITE, designated SEQ ID:34951, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61091] Another function of VGAM1843 is therefore inhibition of KIAA1529 (Accession XM\_047336). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1529. KIAA1674 (Accession XM\_044065) is another VGAM1843 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34112, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61092] Another function of VGAM1843 is therefore inhibition of KIAA1674 (Accession XM\_044065). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. KIAA1679 (Accession XM\_046570) is another VGAM1843 host target gene. KIAA1679 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1679 BINDING SITE, designated SEQ ID:34751, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61093] Another function of VGAM1843 is therefore inhibition of KIAA1679 (Accession XM\_046570). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1679. KIAA1878 (Accession XM\_166256) is another VGAM1843 host target gene. KIAA1878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1878 BINDING SITE, designated SEQ ID:44075, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61094] Another function of VGAM1843 is therefore inhibition of

KIAA1878 (Accession XM\_166256). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1878. Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823) is another VGAM1843 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34290, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61095] Another function of VGAM1843 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. LOC139248 (Accession XM\_066582) is another VGAM1843 host target gene. LOC139248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139248, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139248 BINDING SITE, designated SEQ ID:37335, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61096] Another function of VGAM1843 is therefore inhibition of LOC139248 (Accession XM\_066582). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139248. LOC145225 (Accession XM\_096741) is another VGAM1843 host target gene. LOC145225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145225 BINDING SITE, designated SEQ ID:40526, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61097] Another function of VGAM1843 is therefore inhibition of LOC145225 (Accession XM\_096741). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145225. LOC146756 (Accession XM\_097085) is another VGAM1843 host target gene. LOC146756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146756 BINDING SITE, designated SEQ ID:40736, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61098] Another function of VGAM1843 is therefore inhibition of LOC146756 (Accession XM\_097085). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756. LOC148229 (Accession XM\_086103) is another VGAM1843 host target gene. LOC148229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148229 BINDING SITE, designated SEQ ID:38497, to

the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61099] Another function of VGAM1843 is therefore inhibition of LOC148229 (Accession XM\_086103). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148229. LOC166867 (Accession XM\_094142) is another VGAM1843 host target gene. LOC166867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166867 BINDING SITE, designated SEQ ID:40222, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61100] Another function of VGAM1843 is therefore inhibition of LOC166867 (Accession XM\_094142). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166867. LOC196510 (Accession XM\_113738) is another VGAM1843 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:42395, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61101] Another function of VGAM1843 is therefore inhibition of LOC196510 (Accession XM\_113738). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196510. LOC200220 (Accession XM\_114157) is another VGAM1843 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:42744, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61102] Another function of VGAM1843 is therefore inhibition of LOC200220 (Accession XM\_114157). Accordingly, utilities

of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. LOC200310 (Accession XM\_037840) is another VGAM1843 host target gene. LOC200310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200310 BINDING SITE, designated SEQ ID:32708, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61103] Another function of VGAM1843 is therefore inhibition of LOC200310 (Accession XM\_037840). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200310. LOC201952 (Accession XM\_117345) is another VGAM1843 host target gene. LOC201952 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC201952 BINDING SITE, designated SEQ ID:43394, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61104] Another function of VGAM1843 is therefore inhibition of LOC201952 (Accession XM\_117345). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201952. LOC202934 (Accession XM\_117486) is another VGAM1843 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43459, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61105] Another function of VGAM1843 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC219627 (Accession XM\_166402) is another VGAM1843 host target gene. LOC219627 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219627 BINDING SITE, designated SEQ ID:44274, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61106] Another function of VGAM1843 is therefore inhibition of LOC219627 (Accession XM\_166402). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219627. LOC219848 (Accession XM\_166170) is another VGAM1843 host target gene. LOC219848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219848 BINDING SITE, designated SEQ ID:43986, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61107] Another function of VGAM1843 is therefore inhibition of

LOC219848 (Accession XM\_166170). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219848. LOC222066 (Accession XM\_166582) is another VGAM1843 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:44556, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61108] Another function of VGAM1843 is therefore inhibition of LOC222066 (Accession XM\_166582). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. LOC222962 (Accession XM\_167291) is another VGAM1843 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44629, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61109] Another function of VGAM1843 is therefore inhibition of LOC222962 (Accession XM\_167291). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC254015 (Accession XM\_172977) is another VGAM1843 host target gene. LOC254015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254015 BINDING SITE, designated SEQ ID:46244, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61110] Another function of VGAM1843 is therefore inhibition of LOC254015 (Accession XM\_172977). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254015. LOC254778 (Accession XM\_171193) is an-

other VGAM1843 host target gene. LOC254778 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:45977, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61111] Another function of VGAM1843 is therefore inhibition of LOC254778 (Accession XM\_171193). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778. LOC255465 (Accession XM\_173206) is another VGAM1843 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46452, to the nucleotide sequence of VGAM1843 RNA, herein designated VGAM RNA, also designated SEQ ID:4554.

[61112] Another function of VGAM1843 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM1843 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1844 (VGAM1844) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61113] VGAM1844 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1844 was detected is described hereinabove with reference to Figs. 1-8.

[61114] VGAM1844 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61115] VGAM1844 gene encodes a VGAM1844 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1844 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1844 precursor RNA is designated SEQ ID:1830, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1830 is located at position 20461 relative to the genome of Chimpanzee Cytomegalovirus.

- [61116] VGAM1844 precursor RNA folds onto itself, forming VGAM1844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [61117] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1844 folded precursor RNA into VGAM1844 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1844 RNA is designated SEQ ID:4555, and is provided hereinbelow with reference to the sequence listing part.

[61118] VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1844 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61119] VGAM1844 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1844 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1844 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61120] The complementary binding of VGAM1844 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1844 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1844 host target RNA into VGAM1844 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61121] It is appreciated that VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1844 host target genes. The mRNA of each one of this plurality of VGAM1844 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1844 RNA, herein designated VGAM RNA, and which when bound by VGAM1844 RNA causes inhibition of translation of respective one or more VGAM1844 host target proteins.

[61122] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1844 gene, herein designated VGAM GENE, on one or more VGAM1844 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61123] It is yet further appreciated that a function of VGAM1844 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1844 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1844 correlate with, and may be deduced from, the identity of the host target genes which VGAM1844 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61124] Nucleotide sequences of the VGAM1844 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1844 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1844 are further described hereinbelow with reference to Table 1.

[61125] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1844 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1844 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[61126] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1844 gene, herein designated VGAM is inhibition of expression of VGAM1844 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1844 correlate with, and may be deduced from, the identity of the target genes which VGAM1844 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61127] Alpha-methylacyl-CoA Racemase (AMACR, Accession XM\_043771) is a VGAM1844 host target gene. AMACR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMACR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMACR BINDING SITE, designated SEQ ID:34014, to the nucleotide sequence of VGAM1844 RNA, herein designated VGAM RNA, also designated SEQ ID:4555.

[61128] A function of VGAM1844 is therefore inhibition of Alpha-methylacyl-CoA Racemase (AMACR, Accession XM\_043771). Accordingly, utilities of VGAM1844 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with AMACR. KIAA1305 (Accession NM\_025081) is another VGAM1844 host target gene. KIAA1305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1305 BINDING SITE, designated SEQ ID:24683, to the nucleotide sequence of VGAM1844 RNA, herein designated VGAM RNA, also designated SEQ ID:4555.

[61129] Another function of VGAM1844 is therefore inhibition of KIAA1305 (Accession NM\_025081). Accordingly, utilities of VGAM1844 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1305. LOC145547 (Accession XM\_085167) is another VGAM1844 host target gene. LOC145547 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145547 BINDING SITE, designated SEQ ID:37894, to

the nucleotide sequence of VGAM1844 RNA, herein designated VGAM RNA, also designated SEQ ID:4555.

[61130] Another function of VGAM1844 is therefore inhibition of LOC145547 (Accession XM\_085167). Accordingly, utilities of VGAM1844 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145547. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1845 (VGAM1845) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61131] VGAM1845 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1845 was detected is described hereinabove with reference to Figs. 1–8.

[61132] VGAM1845 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61133] VGAM1845 gene encodes a VGAM1845 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1845 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1845 precursor RNA is designated SEQ ID:1831, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1831 is located at position 23567 relative to the genome of Chimpanzee Cytomegalovirus.

- [61134] VGAM1845 precursor RNA folds onto itself, forming VGAM1845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [61135] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1845 folded precursor RNA into VGAM1845 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1845 RNA is designated SEQ ID:4556, and is provided hereinbelow with reference to the sequence listing part.

[61136] VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1845 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61137] VGAM1845 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1845 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1845 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61138] The complementary binding of VGAM1845 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1845 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1845 host target RNA into VGAM1845 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61139] It is appreciated that VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1845 host target genes. The mRNA of each one of this plurality of VGAM1845 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1845 RNA, herein designated VGAM RNA, and which when bound by VGAM1845 RNA causes inhibition of translation of respective one or more VGAM1845 host target proteins.

[61140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1845 gene, herein designated VGAM GENE, on one or more VGAM1845 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[61141] It is yet further appreciated that a function of VGAM1845 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cy-tomegalovirus. Specific functions, and accordingly utilities, of VGAM1845 correlate with, and may be deduced from, the identity of the host target genes which VGAM1845 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61142] Nucleotide sequences of the VGAM1845 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1845 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1845 are further described hereinbelow with reference to Table 1.

[61143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1845 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1845 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61144] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1845 gene, herein designated VGAM is inhibition of expression of VGAM1845 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1845 correlate with, and may be deduced from, the identity of the target genes which VGAM1845 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61145] CD3Z Antigen, Zeta Polypeptide (TiT3 complex) (CD3Z, Accession NM\_000734) is a VGAM1845 host target gene. CD3Z BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD3Z, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD3Z BINDING SITE, designated SEQ ID:6391, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61146] A function of VGAM1845 is therefore inhibition of CD3Z Antigen, Zeta Polypeptide (TiT3 complex) (CD3Z, Acces-

sion NM\_000734), a gene which may involve in assembly and expression of the tcr complex as well as signal transduction upon antigen triggering. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD3Z. The function of CD3Z and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167. Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM\_022059) is another VGAM1845 host target gene. CXCL16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXCL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL16 BINDING SITE, designated SEQ ID:22596, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61147] Another function of VGAM1845 is therefore inhibition of Chemokine (C-X-C motif) Ligand 16 (CXCL16, Accession NM\_022059), a gene which induces calcium mobilization. Accordingly, utilities of VGAM1845 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with CXCL16. The function of CXCL16 has been established by previous studies. Using a 2-step EST database search in which putative transcripts were scanned for the occurrence of functional patterns, Matloubian et al. (2000) identified a cDNA encoding a CXC chemokine that they termed CXCL16. The predicted 273-amino acid CXCL16 protein, which is 49% identical to the 246-amino acid mouse sequence, contains a non-glu/leu/arg (ELR) motif-containing CXC chemokine domain, a mucin-like spacer region, a transmembrane domain, and a cytoplasmic tail with a potential tyrosine phosphorylation and SH2 protein-binding site. CXCL16 was the first transmembrane CXC chemokine identified; CX3CL1 (SCYD1; 601880), which also has a mucin-like spacer region, was the only other known transmembrane chemokine. Northern blot analysis of mouse and human tissues detected a 2.2-kb CXCL16 transcript in spleen, lymph nodes, Peyer patches, lung, kidney, small intestine, and thymus, with weak expression in heart and liver and no expression in brain and bone marrow. Flow cytometry and Western blot analysis demonstrated expression of an approximately 60-kD glycosylated cell-surface protein as

well as a cell supernatant 35-kD soluble protein. Flow cytometry of cells from mouse tissues indicated that CXCL16 is found on CD11C (ITGAX; 151510)-positive splenic and lymph node dendritic cells; this expression was increased after injection with lipopolysaccharide. Immunohistochemical analysis showed that CXCL16 is expressed in T-cell areas of the splenic white pulp, lymph nodes, the thymus medulla, and, interestingly, in the splenic red pulp. No staining was observed in B-cell areas. After injection of inflammatory mediators, expression was enhanced in T-cell zones and, more prominently, in splenic red pulp. Chemotaxis assays found that CXCL16 induced a strong chemotactic response in activated CD8 T cells. In addition, CXCL16 induced calcium mobilization. Expression cloning of mouse Cxcl16 identified a protein with 71% amino acid identity to human BONZO (OMIM Ref. No. 605163), which Matloubian et al. (2000) renamed CXCR6. Human and mouse cells expressing CXCR6 showed a strong chemotactic response to CXCL16 but not to other chemokines. The authors concluded that CXCL16 and CXCR6 probably function in interactions between dendritic cells and T cells and in regulating T-cell migration in the splenic red pulp. Macrophages endocytose oxi-

dized low density lipoprotein (OxLDL) by a receptor-mediated mechanism. By expression cloning from a phorbol ester-stimulated THP-1 cell library, Shimaoka et al. (2000) isolated a cDNA encoding SRPSOX (scavenger receptor that binds phosphatidylserine and oxidized lipoprotein). The deduced 254-amino acid type I transmembrane protein is identical to the CXCL16 protein reported by Matloubian et al. (2000) except that SRPSOX differs by 2 residues and lacks the N-terminal 19 amino acids. Cells expressing SRPSOX bound to phosphatidylserine-coated plates; this binding could be inhibited by OxLDL. Scatchard analysis confirmed that SRPSOX is a specific receptor for OxLDL but not LDL or acetyl-LDL. Fluorescence microscopy demonstrated OxLDL uptake in SRPSOX-expressing cells. Immunoblot analysis showed that SRPSOX is expressed as a 30-kD protein in human and mouse macrophages. Northern blot analysis revealed differentiation-inducible expression of 1.8- and 2.5-kb transcripts in macrophages.

[61148] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61149] Matloubian, M.; David, A.; Engel, S.; Ryan, J. E.; Cyster, J.

G. : A transmembrane CXC chemokine is a ligand for HIV-coreceptor Bonzo. Nature Immun. 1: 298–304, 2000. ;  
and

[61150] Shimaoka, T.; Kume, N.; Minami, M.; Hayashida, K.; Kataoka, H.; Kita, T.; Yonehara, S. : Molecular cloning of a novel scavenger receptor for oxidized low density lipoprotein, SR-PSOX.

[61151] Further studies establishing the function and utilities of CXCL16 are found in John Hopkins OMIM database record ID 605398, and in cited publications numbered 439 and 7313–7314 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM\_003949) is another VGAM1845 host target gene. HAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAP1 BINDING SITE, designated SEQ ID:10074, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61152] Another function of VGAM1845 is therefore inhibition of

Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM\_003949), a gene which functions as an adaptor protein using coiled coils to mediate interactions among cytoskeletal, vascular, and motor proteins. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAP1. The function of HAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126. Polymeric Immunoglobulin Receptor (PIGR, Accession XM\_052013) is another VGAM1845 host target gene. PIGR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:35936, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61153] Another function of VGAM1845 is therefore inhibition of Polymeric Immunoglobulin Receptor (PIGR, Accession XM\_052013). Accordingly, utilities of VGAM1845 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR. Proteoglycan 2, Bone Marrow (natural killer cell activator, eosinophil granule major basic protein) (PRG2, Accession NM\_002728) is another VGAM1845 host target gene. PRG2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRG2 BINDING SITE, designated SEQ ID:8592, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61154] Another function of VGAM1845 is therefore inhibition of Proteoglycan 2, Bone Marrow (natural killer cell activator, eosinophil granule major basic protein) (PRG2, Accession NM\_002728), a gene which Myelin basic protein; a constituent of myelin, plays a role in nerve function. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRG2. The function of PRG2 has been established by previous studies. Eosinophil granule major basic protein (MBP) comprises the crystalloid core of the

eosinophil granule. Wasmoen et al. (1988) and Weller et al. (1988) published a partial amino acid sequence for MBP, also designated proteoglycan-2 (PRG2). Using this partial sequence, Barker et al. (1988) isolated a full-length PRG2 cDNA from a human promyelocytic leukemia cell line (HL60) cDNA library. McGrogan et al. (1988) independently isolated a PRG2 cDNA from an HL60 cell line cDNA. Yoshimatsu et al. (1992) also identified PRG2 in a search for a natural killer (NK) cell-activating factor purified from the supernatant of a T-cell hybridoma. McGrogan et al. (1988) and Barker et al. (1988) determined that the PRG2 cDNA encodes a deduced 222-amino acid protein with a 15-amino acid hydrophobic signal sequence. PRG2 is initially translated as a 25-kD preproprotein that is post-translationally modified to a proprotein. Posttranslational modification results in the mature form of PRG2, which is encoded by the carboxy 117 amino acids of the preproprotein and has a molecular mass of 14 kD. The 90-amino acid N-terminal domain has 1 potential N-linked glycosylation site. Yoshimatsu et al. (1992) reported that the C-terminal end of PRG2 shares homology with animal lectins. McGrogan et al. (1988) determined that the putative PRG2 proprotein is a bipolar molecule. The amino-

terminal half is hydrophilic, whereas the mature PRG2 is hydrophobic. Barker et al. (1988) hypothesized that the translation of PRG2 as a bipolar proprotein may mask the toxic effects of the mature PRG2 and protect the eosinophil from damage while the protein is processed through the endoplasmic reticulum to its sequestered site in the eosinophil granule. Using Northern blot analysis, McGrogan et al. (1988) detected a major 1-kb transcript and a minor 0.5-kb PRG2 transcript in HL60 cells. By the same method, Li et al. (1995) detected a 1-kb transcript in immature cells including bone-marrow and HL60 cells, but not in purified blood eosinophils. Using RT-PCR, Li et al. (1995) detected an additional 1.6-kb transcript in bone marrow cells and HL60 cells at lower levels than the 1-kb transcript. In differentiated blood eosinophils from idiopathic hypereosinophilic syndrome patients, the 1.6-kb transcript predominated. The International Radiation Hybrid Mapping Consortium mapped the PRG2 gene to chromosome 11 (A005W41). By FISH, Plager et al. (2001) mapped the PRG2 and PRG3 (OMIM Ref. No. 606814) genes to chromosome 11cen-q12.

[61155] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[61156] Li, M.-S.; Sun, L.; Satoh, T.; Fisher, L. M.; Spry, C. J. F. :

Human eosinophil major basic protein, a mediator of allergic inflammation, is expressed by alternative splicing from two promoters. *Biochem. J.* 305: 921–927, 1995. ; and

[61157] Plager, D. A.; Weiler, D. A.; Loegering, D. A.; Johnson, W. B.; Haley, L.; Eddy, R. L.; Shows, T. B.; Gleich, G. J. : Comparative structure, proximal promoter elements, and chromosome lo.

[61158] Further studies establishing the function and utilities of PRG2 are found in John Hopkins OMIM database record ID 605601, and in cited publications numbered 6995–7001 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pleckstrin and Sec7 Domain Protein (PSD, Accession NM\_002779) is another VGAM1845 host target gene. PSD BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSD BINDING SITE, designated SEQ ID:8670, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4556.

[61159] Another function of VGAM1845 is therefore inhibition of Pleckstrin and Sec7 Domain Protein (PSD, Accession NM\_002779), a gene which promotes guanine–nucleotide exchange on arf6. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSD. The function of PSD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM261.Prostaglandin I<sub>2</sub> (prostacyclin) Synthase (PTGIS, Accession NM\_000961) is another VGAM1845 host target gene. PTGIS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGIS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:6666, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61160] Another function of VGAM1845 is therefore inhibition of Prostaglandin I<sub>2</sub> (prostacyclin) Synthase (PTGIS, Accession NM\_000961), a gene which catalyzes the isomerization of

prostaglandin h2 to prostacyclin (= prostaglandin i2). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGIS. The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM\_144585) is another VGAM1845 host target gene. SLC22A12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC22A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:29403, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61161] Another function of VGAM1845 is therefore inhibition of Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM\_144585), a gene which is a urate -anion exchanger regulating blood urate levels. Accordingly, utilities of VGAM1845 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A12. The function of SLC22A12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1034.Unc-13-like (*C. elegans*) (UNC13, Accession NM\_006377) is another VGAM1845 host target gene. UNC13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC13 BINDING SITE, designated SEQ ID:13069, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61162] Another function of VGAM1845 is therefore inhibition of Unc-13-like (*C. elegans*) (UNC13, Accession NM\_006377), a gene which is a putative diacylglycerol receptor and may act in PKC-independent, diacylglycerol-activated apoptosis pathway. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC13. The function of

UNC13 has been established by previous studies. The priming step of synaptic vesicle exocytosis is thought to require the formation of the SNARE complex, which comprises the proteins synaptobrevin (OMIM Ref. No. 185881), SNAP25 (OMIM Ref. No. 600322), and syntaxin (see OMIM Ref. No. 186590). In solution, syntaxin adopts a default, closed configuration that is incompatible with formation of the SNARE complex. Specifically, the amino terminus of syntaxin binds the SNARE motif and occludes interactions with the other SNARE proteins. The N terminus of syntaxin also binds the presynaptic protein UNC13. Studies in mouse, *Drosophila*, and *Caenorhabditis elegans* suggest that UNC13 functions at a post-docking step of exocytosis, most likely during synaptic vesicle priming. Therefore, UNC13 binding to the N terminus of syntaxin may promote the open configuration of syntaxin. To test this model, Richmond et al. (2001) engineered mutations into *C. elegans* syntaxin that caused the protein to adopt the open configuration constitutively. Richmond et al. (2001) demonstrated that the open form of syntaxin can bypass the requirement for UNC13 in synaptic vesicle priming. Thus, Richmond et al. (2001) concluded that it is likely that UNC13 primes synaptic vesicles for fusion by

promoting the open configuration of syntaxin. Animal model experiments lend further support to the function of UNC13. Munc13-1 is a presynaptic protein with an essential role in synaptic vesicle priming. It contains a diacylglycerol (DAG)/beta phorbol ester-binding C1 domain and is a potential target of the DAG second messenger pathway that may act in parallel with protein kinases C (PKCs; OMIM Ref. No. 600448). Using genetically modified mice that expressed a DAG/beta phorbol ester-binding-deficient Munc13-1 variant (missense mutation his567 to lys) instead of the wildtype protein, Rhee et al. (2002) determined the relative contribution of PKCs and Munc13-1 to DAG/beta phorbol ester-dependent regulation of neurotransmitter release. They showed that Munc13s are the main presynaptic DAG/beta phorbol ester receptors in hippocampal neurons. Modulation of Munc13-1 activity by second messengers via the DAG/beta phorbol ester-binding C1 domain is essential for use-dependent alterations of synaptic efficacy and survival.

[61163] It is appreciated that the abovementioned animal model for UNC13 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[61164] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61165] Richmond, J. E.; Weimer, R. M.; Jorgensen, E. M. : An open form of syntaxin bypasses the requirement for UNC-13 in vesicle priming. *Nature* 412: 338–341, 2001. ; and

[61166] Rhee, J.-S.; Betz, A.; Pyott, S.; Reim, K.; Varoqueaux, F.; Augustin, I.; Hesse, D.; Sudhof, T. C.; Takahashi, M.; Rosenmund, C.; Brose, N. : Beta phorbol ester- and diacylglycerol-indu.

[61167] Further studies establishing the function and utilities of UNC13 are found in John Hopkins OMIM database record ID 605836, and in sited publications numbered 6430–6432, 176 and 6433–6434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM\_005433) is another VGAM1845 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com–

plementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:11911, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61168] Another function of VGAM1845 is therefore inhibition of V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM\_005433), a gene which is a putative protein–tyrosine kinase. Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Zinc Finger Protein 137 (clone pHZ–30) (ZNF137, Accession NM\_003438) is another VGAM1845 host target gene. ZNF137 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF137 BINDING SITE, designated SEQ ID:9492, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also des–

ignated SEQ ID:4556.

[61169] Another function of VGAM1845 is therefore inhibition of Zinc Finger Protein 137 (clone pHZ-30) (ZNF137, Accession NM\_003438). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF137. APCL (Accession NM\_005883) is another VGAM1845 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12501, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61170] Another function of VGAM1845 is therefore inhibition of APCL (Accession NM\_005883). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. Chromosome 11 Open Reading Frame 17 (C11orf17, Accession NM\_020642) is another VGAM1845 host target gene. C11orf17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by C11orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf17 BINDING SITE, designated SEQ ID:21806, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61171] Another function of VGAM1845 is therefore inhibition of Chromosome 11 Open Reading Frame 17 (C11orf17, Accession NM\_020642). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf17. Carcinoembryonic Antigen-related Cell Adhesion Molecule 8 (CEACAM8, Accession NM\_001816) is another VGAM1845 host target gene. CEACAM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM8 BINDING SITE, designated SEQ ID:7560, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61172] Another function of VGAM1845 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 8 (CEACAM8, Accession NM\_001816). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM8. DKFZP434P0111 (Accession XM\_041116) is another VGAM1845 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:33456, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61173] Another function of VGAM1845 is therefore inhibition of DKFZP434P0111 (Accession XM\_041116). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. DKFZP566G1424 (Accession XM\_097771) is another VGAM1845 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by DKFZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:41113, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61174] Another function of VGAM1845 is therefore inhibition of DKFZP566G1424 (Accession XM\_097771). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. FLJ14442 (Accession NM\_032785) is another VGAM1845 host target gene. FLJ14442 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:26538, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61175] Another function of VGAM1845 is therefore inhibition of

FLJ14442 (Accession NM\_032785). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442. FLJ20291 (Accession NM\_017748) is another VGAM1845 host target gene. FLJ20291 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20291 BINDING SITE, designated SEQ ID:19340, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61176] Another function of VGAM1845 is therefore inhibition of FLJ20291 (Accession NM\_017748). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20291. FLJ23556 (Accession NM\_024880) is another VGAM1845 host target gene. FLJ23556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:24319, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61177] Another function of VGAM1845 is therefore inhibition of FLJ23556 (Accession NM\_024880). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556. KIAA0720 (Accession XM\_030970) is another VGAM1845 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31236, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61178] Another function of VGAM1845 is therefore inhibition of KIAA0720 (Accession XM\_030970). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA1615 (Accession XM\_044021) is another

VGAM1845 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34087, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61179] Another function of VGAM1845 is therefore inhibition of KIAA1615 (Accession XM\_044021). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. KIAA1727 (Accession XM\_034262) is another VGAM1845 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32035, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61180] Another function of VGAM1845 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1877 (Accession XM\_038616) is another VGAM1845 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32880, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61181] Another function of VGAM1845 is therefore inhibition of KIAA1877 (Accession XM\_038616). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. KIAA1924 (Accession XM\_057091) is another VGAM1845 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36472, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61182] Another function of VGAM1845 is therefore inhibition of KIAA1924 (Accession XM\_057091). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. Nup43 (Accession NM\_024647) is another VGAM1845 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23935, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61183] Another function of VGAM1845 is therefore inhibition of Nup43 (Accession NM\_024647). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43.

Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM\_014759) is another VGAM1845 host target gene. PHYHIP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PHYHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYHIP BINDING SITE, designated SEQ ID:16510, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61184] Another function of VGAM1845 is therefore inhibition of Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM\_014759). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYHIP. PRO1992 (Accession NM\_014107) is another VGAM1845 host target gene. PRO1992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1992 BINDING SITE,

designated SEQ ID:15334, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61185] Another function of VGAM1845 is therefore inhibition of PRO1992 (Accession NM\_014107). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1992. RAP140 (Accession NM\_015224) is another VGAM1845 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17552, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61186] Another function of VGAM1845 is therefore inhibition of RAP140 (Accession NM\_015224). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. LOC121504 (Accession XM\_058571) is another VGAM1845 host target gene. LOC121504 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121504 BINDING SITE, designated SEQ ID:36670, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61187] Another function of VGAM1845 is therefore inhibition of LOC121504 (Accession XM\_058571). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121504. LOC128077 (Accession XM\_059208) is another VGAM1845 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:36915, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61188] Another function of VGAM1845 is therefore inhibition of

LOC128077 (Accession XM\_059208). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC146909 (Accession XM\_085634) is another VGAM1845 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38265, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61189] Another function of VGAM1845 is therefore inhibition of LOC146909 (Accession XM\_085634). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC147080 (Accession XM\_097182) is another VGAM1845 host target gene. LOC147080 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147080 BINDING SITE, designated SEQ ID:40797, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61190] Another function of VGAM1845 is therefore inhibition of LOC147080 (Accession XM\_097182). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147080. LOC147299 (Accession XM\_085763) is another VGAM1845 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38329, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61191] Another function of VGAM1845 is therefore inhibition of LOC147299 (Accession XM\_085763). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147299. LOC151701 (Accession XM\_098109) is an-

other VGAM1845 host target gene. LOC151701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151701 BINDING SITE, designated SEQ ID:41384, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61192] Another function of VGAM1845 is therefore inhibition of LOC151701 (Accession XM\_098109). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151701. LOC154877 (Accession XM\_098626) is another VGAM1845 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41739, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61193] Another function of VGAM1845 is therefore inhibition of LOC154877 (Accession XM\_098626). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC220002 (Accession XM\_166224) is another VGAM1845 host target gene. LOC220002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220002 BINDING SITE, designated SEQ ID:44047, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61194] Another function of VGAM1845 is therefore inhibition of LOC220002 (Accession XM\_166224). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220002. LOC91115 (Accession XM\_036218) is another VGAM1845 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32393, to the nucleotide sequence of VGAM1845 RNA, herein designated VGAM RNA, also designated SEQ ID:4556.

[61195] Another function of VGAM1845 is therefore inhibition of LOC91115 (Accession XM\_036218). Accordingly, utilities of VGAM1845 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1846 (VGAM1846) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61196] VGAM1846 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1846 was detected is described hereinabove with reference to Figs. 1–8.

[61197] VGAM1846 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1846 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61198] VGAM1846 gene encodes a VGAM1846 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1846 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1846 precursor RNA is designated SEQ ID:1832, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1832 is located at position 16140 relative to the genome of Chimpanzee Cytomegalovirus.

[61199] VGAM1846 precursor RNA folds onto itself, forming VGAM1846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61200] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1846 folded precursor RNA into VGAM1846

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1846 RNA is designated SEQ ID:4557, and is provided hereinbelow with reference to the sequence listing part.

[61201] VGAM1846 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1846 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61202] VGAM1846 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1846 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1846 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61203] The complementary binding of VGAM1846 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1846 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1846 host target RNA into VGAM1846 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[61204] It is appreciated that VGAM1846 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1846 host target genes. The mRNA of each one of this plurality of VGAM1846 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1846 RNA, herein designated VGAM RNA, and which when bound by VGAM1846 RNA causes inhibition of translation of respective one or more VGAM1846 host target proteins.

[61205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1846 gene, herein designated VGAM GENE, on one or more VGAM1846 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61206] It is yet further appreciated that a function of VGAM1846 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1846 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1846 correlate with, and may be deduced from, the identity of the host target genes which VGAM1846 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61207] Nucleotide sequences of the VGAM1846 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1846 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1846 are further described hereinbelow with reference to Table 1.

[61208] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1846 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1846 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61209] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1846 gene, herein designated VGAM is inhibition of expression of VGAM1846 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1846 correlate with, and may be deduced from, the identity of the target genes which VGAM1846 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61210] FLJ10713 (Accession NM\_018189) is a VGAM1846 host target gene. FLJ10713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10713 BINDING SITE, designated SEQ ID:20039, to the nucleotide sequence of VGAM1846 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4557.

[61211] A function of VGAM1846 is therefore inhibition of FLJ10713 (Accession NM\_018189). Accordingly, utilities of VGAM1846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10713. FLJ22794 (Accession XM\_166220) is another VGAM1846 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44031, to the nucleotide sequence of VGAM1846 RNA, herein designated VGAM RNA, also designated SEQ ID:4557.

[61212] Another function of VGAM1846 is therefore inhibition of FLJ22794 (Accession XM\_166220). Accordingly, utilities of VGAM1846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. LOC152271 (Accession XM\_087419) is another VGAM1846 host target gene. LOC152271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152271, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152271 BINDING SITE, designated SEQ ID:39239, to the nucleotide sequence of VGAM1846 RNA, herein designated VGAM RNA, also designated SEQ ID:4557.

[61213] Another function of VGAM1846 is therefore inhibition of LOC152271 (Accession XM\_087419). Accordingly, utilities of VGAM1846 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152271. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1847 (VGAM1847) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61214] VGAM1847 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1847 was detected is described hereinabove with reference to Figs. 1-8.

[61215] VGAM1847 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net

Virus. VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61216] VGAM1847 gene encodes a VGAM1847 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1847 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1847 precursor RNA is designated SEQ ID:1833, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1833 is located at position 6650 relative to the genome of Sonchus Yellow Net Virus.

[61217] VGAM1847 precursor RNA folds onto itself, forming VGAM1847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61218] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1847 folded precursor RNA into VGAM1847 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1847 RNA is designated SEQ ID:4558, and is provided hereinbelow with reference to the sequence listing part.

[61219] VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1847 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61220] VGAM1847 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1847 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1847 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61221] The complementary binding of VGAM1847 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1847 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1847 host target RNA into VGAM1847 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61222] It is appreciated that VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1847 host target genes. The mRNA of each one of this plurality of VGAM1847 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1847 RNA, herein designated VGAM RNA, and which when bound by VGAM1847 RNA causes inhibition of translation of respective one or more VGAM1847 host target proteins.

[61223] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1847 gene, herein designated VGAM GENE, on one or more VGAM1847 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61224] It is yet further appreciated that a function of VGAM1847 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1847 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1847 correlate with, and may be deduced from, the identity of the host target genes which VGAM1847 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61225] Nucleotide sequences of the VGAM1847 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1847 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1847 are further described hereinbelow with reference to Table 1.

[61226] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1847 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1847 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61227] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1847 gene, herein designated VGAM is inhibition of expression of VGAM1847 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1847 correlate with, and may be deduced from, the identity of the target genes which VGAM1847 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61228] Absent In Melanoma 1 (AIM1, Accession XM\_166300) is a VGAM1847 host target gene. AIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIM1 BINDING SITE, designated SEQ ID:44113, to the nucleotide sequence of

VGAM1847 RNA, herein designated VGAM RNA, also designated SEQ ID:4558.

[61229] A function of VGAM1847 is therefore inhibition of Absent In Melanoma 1 (AIM1, Accession XM\_166300), a gene which interactions with the cytoskeleton. Accordingly, utilities of VGAM1847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIM1. The function of AIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM808. KIAA1301 (Accession XM\_038999) is another VGAM1847 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32976, to the nucleotide sequence of VGAM1847 RNA, herein designated VGAM RNA, also designated SEQ ID:4558.

[61230] Another function of VGAM1847 is therefore inhibition of KIAA1301 (Accession XM\_038999). Accordingly, utilities of VGAM1847 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1301. LOC157681 (Accession XM\_088363) is another VGAM1847 host target gene. LOC157681 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157681 BINDING SITE, designated SEQ ID:39644, to the nucleotide sequence of VGAM1847 RNA, herein designated VGAM RNA, also designated SEQ ID:4558.

[61231] Another function of VGAM1847 is therefore inhibition of LOC157681 (Accession XM\_088363). Accordingly, utilities of VGAM1847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157681. LOC92391 (Accession XM\_044793) is another VGAM1847 host target gene. LOC92391 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92391 BINDING SITE, designated SEQ ID:34271, to the

nucleotide sequence of VGAM1847 RNA, herein designated VGAM RNA, also designated SEQ ID:4558.

[61232] Another function of VGAM1847 is therefore inhibition of LOC92391 (Accession XM\_044793). Accordingly, utilities of VGAM1847 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1848 (VGAM1848) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61233] VGAM1848 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1848 was detected is described hereinabove with reference to Figs. 1–8.

[61234] VGAM1848 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net Virus. VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61235] VGAM1848 gene encodes a VGAM1848 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1848 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1848 precursor RNA is designated SEQ ID:1834, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1834 is located at position 9698 relative to the genome of Sonchus Yellow Net Virus.

[61236] VGAM1848 precursor RNA folds onto itself, forming VGAM1848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61237] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1848 folded precursor RNA into VGAM1848 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1848 RNA is designated SEQ ID:4559, and is provided hereinbelow with reference to the sequence listing part.

[61238] VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1848 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61239] VGAM1848 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1848 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1848 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61240] The complementary binding of VGAM1848 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1848 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1848 host target RNA into VGAM1848 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61241] It is appreciated that VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1848 host target genes. The mRNA of each one of this plurality of VGAM1848 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1848 RNA, herein designated VGAM RNA, and which when bound by VGAM1848 RNA causes inhibition of translation of respective one or more VGAM1848 host target proteins.

[61242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1848 gene, herein designated VGAM GENE, on one or more VGAM1848 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[61243] It is yet further appreciated that a function of VGAM1848 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1848 correlate with, and may be deduced from, the identity of the host target genes which VGAM1848 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61244] Nucleotide sequences of the VGAM1848 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1848 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1848 are further described hereinbelow with reference to Table 1.

[61245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1848 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1848 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61246] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1848 gene, herein designated VGAM is inhibition of expression of VGAM1848 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1848 correlate with, and may be deduced from, the identity of the target genes which VGAM1848 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61247] Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM\_006359) is a VGAM1848 host target gene. SLC9A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC9A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A6 BINDING SITE, designated SEQ ID:13052, to the nucleotide sequence of VGAM1848 RNA, herein designated VGAM RNA, also designated SEQ ID:4559.

[61248] A function of VGAM1848 is therefore inhibition of Solute

Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM\_006359), a gene which is involved electroneutral exchange of protons for  $\text{Na}^+$  and  $\text{K}^+$  across the mitochondrial inner membrane. Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A6. The function of SLC9A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM493.SPF30 (Accession NM\_005871) is another VGAM1848 host target gene. SPF30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPF30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPF30 BINDING SITE, designated SEQ ID:12489, to the nucleotide sequence of VGAM1848 RNA, herein designated VGAM RNA, also designated SEQ ID:4559.

[61249] Another function of VGAM1848 is therefore inhibition of SPF30 (Accession NM\_005871). Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPF30.

FLJ10035 (Accession NM\_017974) is another VGAM1848 host target gene. FLJ10035 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10035 BINDING SITE, designated SEQ ID:19706, to the nucleotide sequence of VGAM1848 RNA, herein designated VGAM RNA, also designated SEQ ID:4559.

[61250] Another function of VGAM1848 is therefore inhibition of FLJ10035 (Accession NM\_017974). Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10035. Pellino Homolog 1 (Drosophila) (PELI1, Accession NM\_020651) is another VGAM1848 host target gene. PELI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PELI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE, designated SEQ ID:21813, to the nucleotide sequence of VGAM1848 RNA, herein

designated VGAM RNA, also designated SEQ ID:4559.

[61251] Another function of VGAM1848 is therefore inhibition of Pellino Homolog 1 (Drosophila) (PELI1, Accession NM\_020651). Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1. LOC145786 (Accession XM\_096860) is another VGAM1848 host target gene. LOC145786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145786 BINDING SITE, designated SEQ ID:40590, to the nucleotide sequence of VGAM1848 RNA, herein designated VGAM RNA, also designated SEQ ID:4559.

[61252] Another function of VGAM1848 is therefore inhibition of LOC145786 (Accession XM\_096860). Accordingly, utilities of VGAM1848 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145786. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1849 (VGAM1849) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61253] VGAM1849 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1849 was detected is described hereinabove with reference to Figs. 1–8.

[61254] VGAM1849 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Chlorotic Mottle Virus. VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61255] VGAM1849 gene encodes a VGAM1849 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1849 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1849 precursor RNA is designated SEQ ID:1835, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1835 is located at position 1870 relative to the genome of Cowpea Chlorotic Mottle Virus.

[61256] VGAM1849 precursor RNA folds onto itself, forming VGAM1849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61257] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1849 folded precursor RNA into VGAM1849 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1849 RNA is designated SEQ ID:4560, and is provided hereinbelow with reference to the sequence listing part.

[61258] VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1849 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1849 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61259] VGAM1849 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1849 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1849 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61260] The complementary binding of VGAM1849 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1849 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1849 host target RNA into VGAM1849 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61261] It is appreciated that VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1849 host target genes. The mRNA of each one of this plurality of VGAM1849 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1849 RNA, herein designated VGAM RNA, and which when bound by VGAM1849 RNA causes inhibition of translation of respective one or more VGAM1849 host target proteins.

[61262] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1849 gene, herein designated VGAM GENE, on one or more VGAM1849 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61263] It is yet further appreciated that a function of VGAM1849 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of viral infection by Cowpea Chlorotic Mottle Virus. Specific functions, and accordingly utilities, of VGAM1849 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1849 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61264] Nucleotide sequences of the VGAM1849 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1849 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1849 are further described hereinbelow with reference to Table 1.

[61265] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1849 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1849 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61266] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1849 gene, herein designated VGAM is inhibition of expression of VGAM1849 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1849 correlate with, and may be deduced from, the identity of the target genes which VGAM1849

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61267] ATPase, Class VI, Type 11B (ATP11B, Accession XM\_087254) is a VGAM1849 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39147, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61268] A function of VGAM1849 is therefore inhibition of ATPase, Class VI, Type 11B (ATP11B, Accession XM\_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM665. Phosphoinositide-3-kinase, Class 2, Beta

Polypeptide (PIK3C2B, Accession NM\_002646) is another VGAM1849 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8505, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61269] Another function of VGAM1849 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM\_002646). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Cell Division Cycle Associated 7 (CDCA7, Accession NM\_031942) is another VGAM1849 host target gene. CDCA7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDCA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDCA7 BINDING SITE, designated SEQ

ID:25687, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61270] Another function of VGAM1849 is therefore inhibition of Cell Division Cycle Associated 7 (CDCA7, Accession NM\_031942). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDCA7. Hyaluronan Binding Protein 2 (HABP2, Accession NM\_004132) is another VGAM1849 host target gene. HABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:10342, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61271] Another function of VGAM1849 is therefore inhibition of Hyaluronan Binding Protein 2 (HABP2, Accession NM\_004132). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2. KIAA0523

(Accession XM\_041964) is another VGAM1849 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33642, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61272] Another function of VGAM1849 is therefore inhibition of KIAA0523 (Accession XM\_041964). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. LOC122618 (Accession NM\_138790) is another VGAM1849 host target gene. LOC122618 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122618 BINDING SITE, designated SEQ ID:29014, to the nucleotide sequence of VGAM1849 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4560.

[61273] Another function of VGAM1849 is therefore inhibition of LOC122618 (Accession NM\_138790). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122618. LOC154739 (Accession XM\_098602) is another VGAM1849 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41720, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61274] Another function of VGAM1849 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC203276 (Accession XM\_117523) is another VGAM1849 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43489, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61275] Another function of VGAM1849 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM1849 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43513, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61276] Another function of VGAM1849 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC203305. LOC204970 (Accession XM\_114795) is another VGAM1849 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43071, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61277] Another function of VGAM1849 is therefore inhibition of LOC204970 (Accession XM\_114795). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC206324 (Accession XM\_121162) is another VGAM1849 host target gene. LOC206324 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC206324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206324 BINDING SITE, designated SEQ ID:43612, to

the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61278] Another function of VGAM1849 is therefore inhibition of LOC206324 (Accession XM\_121162). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206324. LOC219894 (Accession XM\_167782) is another VGAM1849 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:44797, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61279] Another function of VGAM1849 is therefore inhibition of LOC219894 (Accession XM\_167782). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. LOC254243 (Accession XM\_173233) is another VGAM1849 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46515, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61280] Another function of VGAM1849 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC90038 (Accession XM\_028305) is another VGAM1849 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30652, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61281] Another function of VGAM1849 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities

of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. LOC91796 (Accession XM\_040743) is another VGAM1849 host target gene. LOC91796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91796 BINDING SITE, designated SEQ ID:33373, to the nucleotide sequence of VGAM1849 RNA, herein designated VGAM RNA, also designated SEQ ID:4560.

[61282] Another function of VGAM1849 is therefore inhibition of LOC91796 (Accession XM\_040743). Accordingly, utilities of VGAM1849 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1850 (VGAM1850) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61283] VGAM1850 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1850 was detected is described hereinabove with reference to Figs. 1–8.

[61284] VGAM1850 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net Virus. VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61285] VGAM1850 gene encodes a VGAM1850 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1850 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1850 precursor RNA is designated SEQ ID:1836, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1836 is located at position 1237 relative to the genome of Sonchus Yellow Net Virus.

[61286] VGAM1850 precursor RNA folds onto itself, forming VGAM1850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61287] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1850 folded precursor RNA into VGAM1850 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1850 RNA is designated SEQ ID:4561, and is provided hereinbelow with reference to the sequence listing part.

[61288] VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1850 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[61289] VGAM1850 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1850 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1850 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61290] The complementary binding of VGAM1850 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1850 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1850 host target RNA into VGAM1850 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61291] It is appreciated that VGAM1850 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1850 host target genes. The mRNA of each one of this plurality of VGAM1850 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1850 RNA, herein designated VGAM RNA, and which when bound by VGAM1850 RNA causes inhibition of translation of respective one or more VGAM1850 host target proteins.

[61292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1850 gene, herein designated VGAM GENE, on one or more VGAM1850 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61293] It is yet further appreciated that a function of VGAM1850 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1850 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1850 correlate with, and may be deduced from, the identity of the host target genes which VGAM1850 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61294] Nucleotide sequences of the VGAM1850 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1850 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1850 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1850 are further  
described hereinbelow with reference to Table 1.

[61295] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1850 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1850 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[61296] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1850 gene, herein designated VGAM is  
inhibition of expression of VGAM1850 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1850 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1850  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[61297] BCRP2 (Accession XM\_031102) is a VGAM1850 host target  
gene. BCRP2 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ ID:31276, to the nucleotide sequence of VGAM1850 RNA, herein designated VGAM RNA, also designated SEQ ID:4561.

[61298] A function of VGAM1850 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM1850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. Neural Cell Adhesion Molecule 2 (NCAM2, Accession NM\_004540) is another VGAM1850 host target gene. NCAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCAM2 BINDING SITE, designated SEQ ID:10891, to the nucleotide sequence of VGAM1850 RNA, herein designated VGAM RNA, also designated SEQ ID:4561.

[61299] Another function of VGAM1850 is therefore inhibition of Neural Cell Adhesion Molecule 2 (NCAM2, Accession NM\_004540). Accordingly, utilities of VGAM1850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCAM2. Di-Ras2 (Accession NM\_017594) is another VGAM1850 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ ID:19045, to the nucleotide sequence of VGAM1850 RNA, herein designated VGAM RNA, also designated SEQ ID:4561.

[61300] Another function of VGAM1850 is therefore inhibition of Di-Ras2 (Accession NM\_017594). Accordingly, utilities of VGAM1850 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1851 (VGAM1851) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61301] VGAM1851 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1851 was detected is described hereinabove with reference to Figs. 1–8.

[61302] VGAM1851 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net Virus. VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61303] VGAM1851 gene encodes a VGAM1851 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1851 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1851 precursor RNA is designated SEQ ID:1837, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1837 is located at position 6021 relative to the genome of Sonchus Yellow Net Virus.

[61304] VGAM1851 precursor RNA folds onto itself, forming

VGAM1851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61305] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1851 folded precursor RNA into VGAM1851 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1851 RNA is designated SEQ ID:4562, and is provided hereinbelow with reference to the sequence listing part.

[61306] VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1851 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61307] VGAM1851 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1851 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1851 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61308] The complementary binding of VGAM1851 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1851 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1851 host target RNA into VGAM1851 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61309] It is appreciated that VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1851 host target genes. The mRNA of each one of this plurality of VGAM1851 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1851 RNA, herein designated VGAM RNA, and which when bound by VGAM1851 RNA causes inhibition of translation of respective one or more VGAM1851 host target proteins.

[61310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1851 gene, herein designated VGAM GENE, on one or more VGAM1851 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61311] It is yet further appreciated that a function of VGAM1851 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1851 correlate with, and may be deduced from, the identity of the host target genes which VGAM1851 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[61312] Nucleotide sequences of the VGAM1851 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1851 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1851 are further described hereinbelow with reference to Table 1.

[61313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1851 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1851 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61314] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1851 gene, herein designated VGAM is inhibition of expression of VGAM1851 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1851 correlate with, and may be deduced from, the identity of the target genes which VGAM1851 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[61315] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380) is a VGAM1851 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13079, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61316] A function of VGAM1851 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525.Lectin, Mannose-binding, 1 (LMAN1, Accession

NM\_005570) is another VGAM1851 host target gene. LMAN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LMAN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMAN1 BINDING SITE, designated SEQ ID:12097, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61317] Another function of VGAM1851 is therefore inhibition of Lectin, Mannose-binding, 1 (LMAN1, Accession NM\_005570). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMAN1. Ring Finger Protein 14 (RNF14, Accession NM\_004290) is another VGAM1851 host target gene. RNF14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF14 BINDING SITE, designated SEQ ID:10502, to the nucleotide sequence of

VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61318] Another function of VGAM1851 is therefore inhibition of Ring Finger Protein 14 (RNF14, Accession NM\_004290), a gene which associates with the androgen receptor (AR); functions as a transcriptional coactivator. Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF14. The function of RNF14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281) is another VGAM1851 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42830, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61319] Another function of VGAM1851 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. FLJ20274 (Accession XM\_031455) is another VGAM1851 host target gene. FLJ20274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20274 BINDING SITE, designated SEQ ID:31386, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61320] Another function of VGAM1851 is therefore inhibition of FLJ20274 (Accession XM\_031455). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20274. FLJ21617 (Accession NM\_030897) is another VGAM1851 host target gene. FLJ21617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21617, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21617 BINDING SITE, designated SEQ ID:25165, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61321] Another function of VGAM1851 is therefore inhibition of FLJ21617 (Accession NM\_030897). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21617. KATII (Accession NM\_016228) is another VGAM1851 host target gene. KATII BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KATII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KATII BINDING SITE, designated SEQ ID:18343, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61322] Another function of VGAM1851 is therefore inhibition of KATII (Accession NM\_016228). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KATII. KIAA0090 (Accession XM\_114045) is another VGAM1851 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42650, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61323] Another function of VGAM1851 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. NYD-SP16 (Accession NM\_031952) is another VGAM1851 host target gene. NYD-SP16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NYD-SP16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP16 BINDING SITE, designated SEQ ID:25693, to the nu-

cleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61324] Another function of VGAM1851 is therefore inhibition of NYD-SP16 (Accession NM\_031952). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP16. LOC203378 (Accession XM\_117541) is another VGAM1851 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43557, to the nucleotide sequence of VGAM1851 RNA, herein designated VGAM RNA, also designated SEQ ID:4562.

[61325] Another function of VGAM1851 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM1851 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1852 (VGAM1852) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61326] VGAM1852 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1852 was detected is described hereinabove with reference to Figs. 1–8.

[61327] VGAM1852 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net Virus. VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61328] VGAM1852 gene encodes a VGAM1852 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1852 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1852 precursor RNA is designated SEQ ID:1838, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1838 is located at position 1792 relative to the genome of Sonchus Yellow Net Virus.

[61329] VGAM1852 precursor RNA folds onto itself, forming VGAM1852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61330] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1852 folded precursor RNA into VGAM1852 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1852 RNA is designated SEQ ID:4563, and is provided hereinbelow with reference to the sequence listing part.

[61331] VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1852 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1852 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61332] VGAM1852 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1852 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1852 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61333] The complementary binding of VGAM1852 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1852 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1852 host target RNA into VGAM1852 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61334] It is appreciated that VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1852 host target genes. The mRNA of each one of this plurality of VGAM1852 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1852 RNA, herein designated VGAM RNA, and which when bound by VGAM1852 RNA causes inhibition of translation of respective one or more VGAM1852 host target proteins.

[61335] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1852 gene, herein designated VGAM GENE, on one or more VGAM1852 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61336] It is yet further appreciated that a function of VGAM1852 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1852 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1852 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61337] Nucleotide sequences of the VGAM1852 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1852 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1852 are further described hereinbelow with reference to Table 1.

[61338] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1852 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1852 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61339] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1852 gene, herein designated VGAM is inhibition of expression of VGAM1852 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1852 correlate with, and may be deduced from, the identity of the target genes which VGAM1852

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61340] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 4 (ABCB4, Accession NM\_000443) is a VGAM1852 host target gene. ABCB4 BINDING SITE1 and ABCB4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCB4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB4 BINDING SITE1 and ABCB4 BINDING SITE2, designated SEQ ID:6029 and SEQ ID:20834 respectively, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61341] A function of VGAM1852 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 4 (ABCB4, Accession NM\_000443). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB4. 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868) is another VGAM1852 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:6532, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61342] Another function of VGAM1852 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM\_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052. CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM\_003663) is another VGAM1852 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9743, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61343] Another function of VGAM1852 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM\_003663). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. DKFZP434G1411 (Accession XM\_166383) is another VGAM1852 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:44231, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61344] Another function of VGAM1852 is therefore inhibition of DKFZP434G1411 (Accession XM\_166383). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434G1411. FLJ10154 (Accession NM\_018011) is another VGAM1852 host target gene. FLJ10154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10154 BINDING SITE, designated SEQ ID:19744, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61345] Another function of VGAM1852 is therefore inhibition of FLJ10154 (Accession NM\_018011). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10154. FLJ14281 (Accession NM\_024920) is another VGAM1852 host target gene. FLJ14281 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14281 BINDING SITE, designated SEQ ID:24451, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM

RNA, also designated SEQ ID:4563.

[61346] Another function of VGAM1852 is therefore inhibition of FLJ14281 (Accession NM\_024920). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14281. FLJ20457 (Accession NM\_017832) is another VGAM1852 host target gene. FLJ20457 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20457 BINDING SITE, designated SEQ ID:19497, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61347] Another function of VGAM1852 is therefore inhibition of FLJ20457 (Accession NM\_017832). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20457. Glia Maturation Factor, Beta (GMFB, Accession NM\_004124) is another VGAM1852 host target gene. GMFB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GMFB,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMFB BINDING SITE, designated SEQ ID:10327, to the nucleotide sequence of VGAM1852 RNA, herein designated VGAM RNA, also designated SEQ ID:4563.

[61348] Another function of VGAM1852 is therefore inhibition of Glia Maturation Factor, Beta (GMFB, Accession NM\_004124). Accordingly, utilities of VGAM1852 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMFB. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1853 (VGAM1853) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61349] VGAM1853 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1853 was detected is described hereinabove with reference to Figs. 1–8.

[61350] VGAM1853 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net

Virus. VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61351] VGAM1853 gene encodes a VGAM1853 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1853 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1853 precursor RNA is designated SEQ ID:1839, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1839 is located at position 3373 relative to the genome of Sonchus Yellow Net Virus.

[61352] VGAM1853 precursor RNA folds onto itself, forming VGAM1853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61353] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1853 folded precursor RNA into VGAM1853 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1853 RNA is designated SEQ ID:4564, and is provided hereinbelow with reference to the sequence listing part.

[61354] VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1853 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61355] VGAM1853 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1853 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1853 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61356] The complementary binding of VGAM1853 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1853 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1853 host target RNA into VGAM1853 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61357] It is appreciated that VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1853 host target genes. The mRNA of each one of this plurality of VGAM1853 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1853 RNA, herein designated VGAM RNA, and which when bound by VGAM1853 RNA causes inhibition of translation of respective one or more VGAM1853 host target proteins.

[61358] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1853 gene, herein designated VGAM GENE, on one or more VGAM1853 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61359] It is yet further appreciated that a function of VGAM1853 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1853 correlate with, and may be deduced from, the identity of the host target genes which VGAM1853 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61360] Nucleotide sequences of the VGAM1853 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1853 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1853 are further described hereinbelow with reference to Table 1.

[61361] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1853 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1853 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61362] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1853 gene, herein designated VGAM is inhibition of expression of VGAM1853 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1853 correlate with, and may be deduced from, the identity of the target genes which VGAM1853 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61363] Cadherin 17, LI Cadherin (liver-intestine) (CDH17, Accession NM\_004063) is a VGAM1853 host target gene. CDH17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH17 BINDING SITE, designated SEQ

ID:10270, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61364] A function of VGAM1853 is therefore inhibition of Cadherin 17, LI Cadherin (liver–intestine) (CDH17, Accession NM\_004063), a gene which may have a role in the morphological organization of liver and intestine and involved in intestinal peptide transport. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH17. The function of CDH17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Copine III (CPNE3, Accession NM\_003909) is another VGAM1853 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:9995, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61365] Another function of VGAM1853 is therefore inhibition of Copine III (CPNE3, Accession NM\_003909), a gene which may function in membrane trafficking. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Cullin 3 (CUL3, Accession NM\_003590) is another VGAM1853 host target gene. CUL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:9646, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61366] Another function of VGAM1853 is therefore inhibition of Cullin 3 (CUL3, Accession NM\_003590), a gene which may target other proteins for ubiquitin-dependent proteolysis. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with CUL3. The function of CUL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM143. Follistatin-like 1 (FSTL1, Accession NM\_007085) is another VGAM1853 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13953, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61367] Another function of VGAM1853 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM\_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with refer-

ence to VGAM791. Glycoprotein M6A (GPM6A, Accession NM\_005277) is another VGAM1853 host target gene. GPM6A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPM6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPM6A BINDING SITE, designated SEQ ID:11779, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61368] Another function of VGAM1853 is therefore inhibition of Glycoprotein M6A (GPM6A, Accession NM\_005277), a gene which may play a role in neuronal development. Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6A. The function of GPM6A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM326. Interleukin 8 (IL8, Accession XM\_170504) is another VGAM1853 host target gene. IL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

IL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL8 BINDING SITE, designated SEQ ID:45339, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61369] Another function of VGAM1853 is therefore inhibition of Interleukin 8 (IL8, Accession XM\_170504). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL8. Uridine Monophosphate Synthetase (orotate phosphoribosyl transferase and orotidine-5'-decarboxylase) (UMPS, Accession NM\_000373) is another VGAM1853 host target gene. UMPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UMPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UMPS BINDING SITE, designated SEQ ID:5941, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61370] Another function of VGAM1853 is therefore inhibition of

Uridine Monophosphate Synthetase (orotate phosphoribosyl transferase and orotidine-5'-decarboxylase) (UMPS, Accession NM\_000373). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UMPS. Claudin 1 (CLDN1, Accession NM\_021101) is another VGAM1853 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22084, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61371] Another function of VGAM1853 is therefore inhibition of Claudin 1 (CLDN1, Accession NM\_021101). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. DKFZp434E2220 (Accession NM\_017612) is another VGAM1853 host target gene. DKFZp434E2220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DK-

FZp434E2220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E2220 BINDING SITE, designated SEQ ID:19112, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61372] Another function of VGAM1853 is therefore inhibition of DKFZp434E2220 (Accession NM\_017612). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E2220. FLJ12409 (Accession NM\_025105) is another VGAM1853 host target gene. FLJ12409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:24755, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61373] Another function of VGAM1853 is therefore inhibition of FLJ12409 (Accession NM\_025105). Accordingly, utilities of

VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409. FLJ20274 (Accession XM\_031455) is another VGAM1853 host target gene. FLJ20274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20274 BINDING SITE, designated SEQ ID:31387, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61374] Another function of VGAM1853 is therefore inhibition of FLJ20274 (Accession XM\_031455). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20274. FLJ22056 (Accession NM\_022489) is another VGAM1853 host target gene. FLJ22056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22056

BINDING SITE, designated SEQ ID:22870, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61375] Another function of VGAM1853 is therefore inhibition of FLJ22056 (Accession NM\_022489). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22056. FLJ23598 (Accession NM\_024783) is another VGAM1853 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:24156, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61376] Another function of VGAM1853 is therefore inhibition of FLJ23598 (Accession NM\_024783). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. HIC (Accession XM\_041273) is another VGAM1853 host target gene. HIC BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC BINDING SITE, designated SEQ ID:33493, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61377] Another function of VGAM1853 is therefore inhibition of HIC (Accession XM\_041273). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC. KIAA1500 (Accession XM\_034353) is another VGAM1853 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32068, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61378] Another function of VGAM1853 is therefore inhibition of

KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702) is another VGAM1853 host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:34266, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61379] Another function of VGAM1853 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM\_044702). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10. PRO0082 (Accession NM\_018590) is another VGAM1853 host target gene. PRO0082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0082, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0082 BINDING SITE, designated SEQ ID:20670, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61380] Another function of VGAM1853 is therefore inhibition of PRO0082 (Accession NM\_018590). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0082. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM\_007231) is another VGAM1853 host target gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:14102, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61381] Another function of VGAM1853 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter),

Member 14 (SLC6A14, Accession NM\_007231). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. LOC256733 (Accession XM\_173116) is another VGAM1853 host target gene. LOC256733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256733 BINDING SITE, designated SEQ ID:46369, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.

[61382] Another function of VGAM1853 is therefore inhibition of LOC256733 (Accession XM\_173116). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256733. LOC83690 (Accession NM\_031461) is another VGAM1853 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:25484, to the nucleotide sequence of VGAM1853 RNA, herein designated VGAM RNA, also designated SEQ ID:4564.
